

Dhruv Deshpande
CSE-DS

Company : AuxoAI

Job Profile: AI Engineer

Offer Type: Internship + Performance Based PPO

Internship Stipend: 60,000 per month.

CTC: Base: 14LPA

Joining Bonus: 1 Lakh

Performance Bonus: 2.1 Lakhs

Retention Bonus: 10 Lakhs paid after 3 years .

Location: Mumbai/Bangalore/Gurgaon/Hyderabad.

Process Date:

11 /09/25: OA

12th :Interviews

Placement Process:

The superset application for AuxoAI was opened for us on 4th September 2025. The eligibility criteria for applying was CGPA $\geq$ 7. There were 5 rounds in total:

1. **Resume shortlisting** .
2. **Online Assessment**
3. **Technical Round 1**
4. **Culture Fit Round** (Basically a techno-HR round)
5. **HR round**

Before you read further, I want to inform you that this experience is focused on a **Machine Learning (ML)** role, not a SDE role. For SDE-specific experiences, I recommend referring to the experiences shared by my peers who were placed in SDE roles.

1.Resuming Shortlisting : (I think around 90-100 students appeared)

In the resume shortlisting round, we were evaluated on our resumes based on the job description provided by the company. Around **50 students were selected** after this round .While I cannot exactly pinpoint the formula to succeed, a good way to increase your probability of succeeding would be to **include the skills and languages mentioned in the JD in your resume.**

Resume Tips:

1.Since this is an **AIML** role, I would suggest that you should have **all the projects in the field of AIML**. Please try not to include development projects (if possible). All the 3 projects mentioned on my resume were based on machine learning.

2. I would recommend including **1–2 projects** on your resume where you have developed **machine learning models from scratch**. These projects highlight your ability to code from scratch and demonstrate a strong fundamental understanding of concepts.

3. **Work experience is always appreciated**. Try to have an internship before the placement season starts. I did not have any experience and thus was a bit tensed about my chances for this round .

2. Online Assessment (Around 50 students appeared for the test):

The test was conducted on campus in the afternoon (around 4pm). The duration of the test was 60 minutes, and there were 2 sections : **1. Aptitude section (20 questions)** , **2. Coding section (4 questions)**. **Navigation was strict**(once you visited a question , you could not visit it again). The aptitude section consisted mainly of topics like **speed-time problems , simple interest-compound interest, trigonometry and ratios**. The coding section consisted of the following questions:

1. **A basic string traversal question**
2. A question similar to [Rotate Array - LeetCode](#).
3. **A question on finding previous smaller element (Can be implemented using a stack).**
4. **Implementing Logistic regression from scratch.**

For some reason , Java was not included in the list of available languages. Since I used Java , I was worried. So , **I quickly changed my strategy** and instead tried to solve all the questions of aptitude. **I completed around 18 -19 questions correctly in around 45 minutes** and then in the 15 minutes left , tried to solve the coding questions, With some basic knowledge and some common sense , I passed some test cases of all the questions(In 1 question , I passed 50 percent cases and in the others 20 30 percent) and thus the test concluded.

Tips:

1. Try to have C++ or Python as your primary language and then study OOPS in Java for a well-rounded knowledge base. Even though I knew to solve the coding questions and would have solved all of them collectively in less than 10 minutes(but in Java), my rigidity with Java would have resulted in a costly fumble.

2. The aptitude section for AuxoAI was of a moderate to high difficulty level .I personally used my strong intuition of mathematics to solve the questions. While I had all the time in the world to solve the questions , it won't always be the same .I solved 18-19 questions .

Overall 10 students were **selected** for the interviews and I was **glad** to be among them.

3. [Technical Round 1]: (10 Students appeared for this round)

The results for the OA were declared around 12 in the night and the interviews were scheduled from 11 in the morning. There were **2 interviewers in each panel**. I introduced myself to the panel and then they asked me to select a project on which a deep dive could be possible . I chose the first project on my resume(It was a **LSTM+ XGBOOST** hybrid model) , where I explained in detail the methodology of the project . They proceeded by asking the information about the columns used and why only those were selected, the source of the data , the number of rows present , and related questions. They then asked me to tell **the metrics of the model (R2_SCORE and the MSE error)** and inquired about the mathematical formulas of the metrics

and the intuition behind them.(Some questions such as “explain R2_score to a layman” were also asked. Then I was asked in detail (bohot depth me gaye) about **XGBOOST and LSTM** and the mathematical intuition behind them .I answered almost all the questions correctly and they were pleased with my fundamentals.They asked me about the **gradient descent algorithm** and how it works and its mathematical intricacies(fundamental understanding of coordinate geometry and curves is needed). Finally I was asked a bit about GEN-AI .

To wrap up the interview , I was asked a **simple DSA question.(Sieve of Eratosthenes)** . The expectation was to write a working code . I explained the brute force solution and then explained in detail the optimal approach . I coded the solution (easy tha) and they were pleased by it(it seemed) .Next I was asked about the **TC and the SC of the solution** ,and I correctly answered it. The interview concluded with me asking a question to the panel . The round lasted around 40 minutes.

Tips: 1. Have **strong fundamentals** of machine learning and mathematics.
2. **Be calm.**

4.Technical Round 2 : (5 students appeared for this round)

The interview started with my introduction to the panel and another discussion on my projects ensued. They asked many questions on the projects , the technical difficulties and the non technical difficulties which I faced (This was a group project). **I was asked about gradient descent and was able to answer almost all the follow up questions on it .**

Following this, I was asked to design a chatbot for some application (I think this was to check the understanding of the software development cycle). While I initially stumbled , I was able to rectify and refine my approach iteratively .

Finally I was asked a **guesstimate** on the number of pizzas eaten on a Saturday night in India. The round lasted around 30 minutes.

Tips: 1. In the guesstimate, I did all the calculations mentally , rather than on paper. This can help you . Also it is important to break the problem statement into smaller parts and then find the solution.
2.**Be calm.**

Round 5: HR ROUND (3 students appeared for this round):

This was an informal round conducted by the MD of the company. It lasted around 10 minutes for me .It was just an informal chat wherein he asked me about my day , how do I feel about the situation and just some information on the company .

Tips:

1. **A calm mind is the need of the hour** .You might be put in unknown and extreme high pressure situations throughout the whole placement process and it is important to **not lose your sense of reasoning** .
2. Prepare answers for standard HR questions beforehand (jot down the main points) and then try to relate all these points to weave a story .

The interviews concluded by 7 pm on 12/09/25. After that, I departed for my home .But the results were not announced that night and also the following night .**It was a really long wait** and finally the results were announced on 15/09/25. **I was selected finally.**

Resources:

1.For Machine Learning and Deep Learning ,**CampusX** has the best playlist on YT.
1. Playlist name: 100 Days of Machine Learning
2. Playlist name:100 Days of Deep Learning
3.He is making some new playlists on advanced topics as well , do check it out .

2. **3BLUE1BROWN** (YT channel) has some playlists on mathematics. Do check it out .

3.For Puzzles:

Since this is a machine learning role , puzzles would be asked mostly on probability(like coins and cards), also you can refer to GFG for top 100 puzzles.

4.DSA: Follow Striver's sheet and then specifically pick some questions from a topic which can help you revise the entire topic. Just do those questions before the OA.(just a suggestion).

General Tips and a small peek into my journey:

1. **My placement journey would not have been possible without the constant support of my parents and friends.** Have a strong group of people around you who genuinely wish for your success. I feel blessed and lucky to have so many good people in my life. **Also , be genuinely happy about others' achievements.**

2. **Believe in God's plan.**

3. My placement journey lasted 78 days.I cleared the online assessments of General Mills (summer intern) , PhonePE , ZETA , IDFC , BrowserStack , BlackRock , Mahindra and then finally AuxoAI. I was rejected in the initial rounds in General Mills (was asked a NP hard problem) , PhonePE(I was not confident enough and thus underperformed), IDFC (was asked about cloud, Springboot (topics which I did not study)), Browserstack. I reached the last round in ZETA but was rejected. In BlackRock , I was not given a chance to give an interview even after clearing the OA (was waitlisted). Throughout this process , I was not asked about any of the projects in even 1 of the interviews and then in AuxoAI , I was asked in detail about my projects(I honestly built the projects) . So , it was a bad streak of luck(for about 2 months) .**The thing to note here is that it is fine to take a break of 1-2 days after a rejection and then have a fresh start leaving everything behind .**

4. **Patience is something which is quite underrated in this journey.** While people around you might be in a hurry to get placed, it is important to keep calm, think rationally, and then take any decision.

5. **Luck and the importance of timing cannot be understated in this journey.** While consistently getting the toughest questions in OAs (randomized questions in OA) broke me , **I was really lucky that AuxoAI came for hiring. Luck evens out in the end (law of averages) but for luck to be on your side, you should be ready to work really hard even in adversity.**

I sincerely hope that each one of you achieves more than what you dream of, finds great success, and be satisfied. May your batch perform even better than our batch.

All the very best !!
