

Company: Oracle Financial Services Software

Job Profile: Associate Consultant

Offer Type: Placement Only

CTC: 9.82 LPA

Location: Mumbai/Pune/Bangalore/Chennai

Process Date: 8th October, 2025

You may not have a good start, but you can write a perfect ending.

Placement Process:

1. Online Assessment Round: (36 questions, 120 minutes)
2. Technical Interview I
3. Technical Interview II
4. HR Round

1. Online Assessment Round:

The online assessment round was conducted on the HackerRank platform. It consisted of 36 questions to be solved in 120 minutes, covering topics from Computer Networking, Operating Systems, SQL, Logical Reasoning, Probability, and Puzzles, along with two DSA questions based on sliding windows and trees. The sliding window problem was easy, while the tree problem was of medium difficulty.

There were also multiple SQL query-based questions that tested the basics of joins, aggregate functions, and constraints. The non-technical questions focused on aptitude and logical reasoning, which included probability-based problems and short analytical puzzles.

We had to take the test from home due to heavy rainfall, which made it impossible to conduct the online assessment on campus that day. The overall difficulty level of the test was slightly higher. I was able to solve the sliding window question completely and the tree problem partially, along with most of the aptitude and core subject MCQs.

Note: This test was conducted for the **OFSS Associate Application Developer** role. Although I was not selected for the interviews for that position, OFSS returned a few days later to hire for the **Consultant** role. They shortlisted candidates based on the performance in the same test conducted

for the Developer role, and by God's grace, I was shortlisted. So, make sure to give your 100% in this test!

2. Technical Interview I:[27 students got selected for this round]

The interviews began soon after the pre-placement talk ended at around 12:00 p.m.

I was allotted to **Panel 1**, and I was the second candidate from my panel to be interviewed. As soon as I entered the room, the interviewer greeted me, offered me a seat, and asked me to introduce myself. After my introduction, he went through my resume and asked about the first project mentioned in it. He then questioned some of my technical choices, such as why I used **JavaScript** for the project, why I didn't use **Next.js**, and how I would convince him to use **React** instead of **Next.js**.

Since I had used a **Sentence Transformer model** in my project, he asked me whether I was familiar with **NLP**. I told him that NLP is one of my core subjects this semester. His focus then shifted to NLP-related questions — he asked me about **vectorization**, **tokenization**, **sentiment analysis**, **stopwords**, and the **difference between RAG and LLM**. As I had my **NLP mid-semester exam** just two days earlier, I was confident and able to answer most of his questions well.

Then his focus shifted to **DSA**, and he gave me a question on **valid anagrams** to solve. I wrote the pseudocode for it on paper, and the interviewer seemed quietly satisfied with my approach. After that, he asked me to write code to **sort a string**, which I implemented using **bubble sort**.

Next, the discussion moved to **DBMS and SQL**. He asked me to write a query to find the **second-highest salary**, which I solved using **subqueries**. Then he asked for the **average salary department-wise**, which can be done using either **GROUP BY** or **window functions**—I chose to solve it using window functions. He further asked about the **difference between SQL and NoSQL**, **how to optimize a database**, and the **difference between partitioning and sharding**, as well as between **vertical and horizontal partitioning**.

He also questioned me about **candidate keys**, **primary keys**, and **foreign keys**. Since I had mentioned **MongoDB** in my technical section, he asked me how to fetch the **second-highest salary** using MongoDB.

After that, he moved to **OOPs concepts** and asked me to elaborate on the **four pillars of OOPs** with real-life examples. As my primary programming language is **C++**, he still asked whether **multiple inheritance** is supported in **Java**, along with some **basic questions on memory management in Java**.

He then shifted to **React**, asking about **Hooks**, followed by some basic questions on **Postman**, **Thunder Client**, **Git**, and **GitHub**.

At the end of the interview, he asked if I had any questions for him. I inquired about the **type of work involved in the role** and the **training process**. The entire round lasted for about **40–45 minutes**.

Note: It is not necessary to give the correct answer to every question the interviewer asks. The key is to stay **confident** throughout. If you don't know the answer to a question, avoid directly saying "*I don't know.*" Instead, try to **relate the question to some relevant concepts** and explain your thought process. If the interviewer is still not satisfied, you can politely say, "*I'm not completely sure about this, but I'll definitely look into it.*"

3. **Technical-Interview II** [Around 20 students got shortlisted for this]

For this round, I was the second candidate in my panel to be interviewed. This round was purely focused on **databases** and lasted for around **50–55 minutes**. All the questions were based on **SQL, MongoDB, and Database Management Systems (DBMS)**.

The interviewer first asked me to **introduce myself**, and then, similar to the first round, he asked me to **explain my first project**. He also asked me to **design the schema** of my project on paper. While designing, I explained my approach, discussed how I chose the **primary keys**, the **cardinalities**, and the **relationships between tables**.

After that, he asked me to write several **SQL queries**—around **7 to 8 in total**—and I was able to solve all of them. There were also some **output prediction questions**. He asked me the **difference between DROP, TRUNCATE, and DELETE** commands, and in which scenarios **DELETE** is used. I explained that **DELETE** is used with the **WHERE** condition. Then he gave me the query **DELETE FROM table;** and asked whether it would work without a **WHERE** condition. I answered that it would work, but it would be **slower than DROP** since it deletes the rows one by one.

Next, he asked about **ACID properties, deadlocks**, and the **types of SQL commands**. I mentioned **DDL, DML, DCL, and TCL**. He then asked me to elaborate on **TCL commands**, and I explained **COMMIT, ROLLBACK, and SAVEPOINT**. He also asked a **scenario-based question** related to **SAVEPOINT**, which I was not completely sure about, so I politely told him that I was **not very familiar with that concept**.

Then he moved on to ask the **difference between functions and procedures**, gave me a query to write a **trigger**, and followed up with multiple questions on **views, joins, aggregate functions, procedures, UNION, and UNION ALL**. He also asked about **cursors** in databases—which I honestly didn't know—and several questions on **indexing**, including the **difference between**

clustered and non-clustered indexes, and whether **indexing would be effective for a table with millions of rows**, along with a few **scenario-based questions**.

I was able to answer **most of the questions** in this round, except for one or two. Overall, I was quite **confident** about my performance, and I was **shortlisted for the HR round**.

4. **HR Round**[Around 12 students got shortlisted for this]

This round was more of a **casual discussion and confirmation round**, but I was quite **nervous** before it began. When I entered the room, the **HR interviewer noticed my nervousness** and kindly asked me to take a few deep breaths to relax.

He then asked me about my **nationality, strengths and weaknesses**, and my **extracurricular activities**. I mentioned that I enjoy **playing and watching cricket**. He asked me who my favorite cricket player was, and I said **Virat Kohli**. We spent the next **2–3 minutes discussing Virat Kohli's mindset and attitude**, which made the conversation more engaging and comfortable.

This round lasted for about **7–8 minutes**.

After the HR round, **12 candidates received job offers**, and I was **one of them**.

Useful Tips:

The **placement process** was quite **frustrating** for me. Despite having good technical skills, I was not getting shortlisted for **online assessments (OAs)** due to my **low CGPA**. So, I strongly suggest maintaining a good CGPA throughout your academics. Try to keep it **above 7.5**, but to maximize your chances of getting shortlisted by most companies, aim for a **CGPA of 8 or higher**.

In the few companies where I did get shortlisted, I couldn't clear the OAs—mainly because of **weak aptitude skills** and, honestly, a bit of **bad luck**. So, along with **DSA**, make sure to **practice aptitude questions** regularly. I personally recommend using **IndiaBix** for aptitude preparation.

OFSS was my **first interview**, and by **God's grace**, I was able to perform well and get through it.

My Preparation Strategy:

- **DSA:** Follow **Striver's A2Z SDE Sheet**
- **Computer Fundamentals:** Refer to **GeeksforGeeks** articles
- **Aptitude:** Practice from **IndiaBix**

Alongside these, I also prepared **interview questions** on **DBMS, SQL, Operating Systems, Computer Networks, OOPs, JavaScript, React**, and other **technical skills** mentioned in my resume—mostly from **GeeksforGeeks**.
