

Company: Baker Hughes

Job Profile: Digital Technology Intern

Offer Type: Internship + Placement

Internship Stipend: 40k

CTC: 11 LPA

Location: Bengaluru / Mumbai

Process Date:

- PPT + OA: 11th August 2025
- Digital Interview: 12th August 2025
- On-campus Interviews: 14th August 2025

Placement Process:

1. **Online Assessment** [187 candidates appeared for this round]

Platform: Microsoft Forms (Proctored)

Questions: 20 (MCQs)

Time: 30 mins

Note: There was no auto submit, so make sure to click the submit button before the time ends. Only then your submission will be recorded.

The questions were very basic but it spanned almost all the subjects and topics, from DBMS, CCN, OS, OOPS (guess the output), Programming (Java and C++ and I think 1 question was from C too). Questions were also from Quantitative Aptitude, Logical Reasoning, English (basic grammar, synonyms, antonyms).

Some tips for this round:

1. Keep your basics for these subjects crystal clear. Start preparing for core subjects and aptitude 3-4 months before the season starts. I started late and made some mistakes with earlier companies. So start as early as possible.
2. Revision is the key here. Due to Hyperverge's case study I did not study much for this OA, but my preparation and revision helped. I had made notes in my 2nd year about those subjects. Also I had made formula sheets about Aptitude which helped. So I just revised these things and went for the OA.
3. One important thing I noticed is that the questions were not section-wise so be prepared to see an aptitude question just after an oops question.

My test went pretty well and I was shortlisted for the next round.

2. **Digital Interview** [45 candidates appeared for this round]

Platform: HireVue

Type of Questions: Typical HR and behavioural questions.

Time per question: Max 3 mins per question. You can stop the recording once done.

Preparation time: 30 seconds before the 3 mins start.

Note:

There is no button to pause/retry the recording, you have 3 mins to record the answer and a single attempt. You go to the next question after one is done.

Questions that were asked:

1. Why did you choose your current degree program?
2. What do you aim to gain from this internship?
3. Tell us about a challenging project experience.
4. How did you manage multiple priorities and time?
5. Tell us about a time when you realized you have a weakness and how did you try to overcome that?
6. What'd you like us to know more about you?

These questions were the same for everyone.

Some tips for this round:

1. Please focus on speaking and articulating your thoughts well. Try to think how you will structure your answer in the given 30 seconds.
2. Do not make any scripts, or use GPT in any form for making these answers, because that will completely look unnatural.
3. I think they did observe the body language and eye contact with the camera. So try to maintain a good posture, hand movements and good eye contact with the camera. Keep a decent smile (don't overdo) on your face while speaking the answers. Visualize as if you are speaking to a real person, it helps.

3. [Oncampus F2F Interview: Technical Round] [34 candidates appeared for this round]

There were 2 panelists. One of them was fully Technical and the other was both Technical and HR (I think).

We were called at 9:30 am in the morning. The TPCs collected all our resumes before the Interviews began. I was called in, the interview started with an excited greeting and warm welcome from their side. The Panelists were super friendly and since I was a little bit nervous, they fully made me feel comfortable. They first glanced over my resume for 10-20 seconds and then asked me to introduce myself. I had prepared two different kinds of introductions, one for technical and one for HR. I gave the technical one here. I had mentioned Java OOPs in my introduction and resume, so they started with that. They asked to explain in detail, what is OOPs, what the pillars are, and give me examples for each with code. Trick to remember the pillars is: A PIE

Challenge 1: Here I got my first challenge of the Interview. I started with A i.e. Abstraction. I gave an example of a car and its engine and that each engine might have a different implementation, but the programmer need not care about the implementation, he just has to use the `defineEngine()` method. I then gave the code for it.

After this, the Interviewer said take this Car example only and all the remaining pillars! This was the first SHOCK. We usually prepare different examples for each pillar but I think he knew this so he kind of restricted it to a single example to test my understanding. I did not have such examples, but my understanding was very good so I took a couple of mins but made the examples and their code.

They were impressed by my understanding and that I on my own insisted on writing the code. Though I do DSA in C++ which is why my Java syntax had a couple of errors. He pointed out that but then I explained to him and he said it is completely fine.

Then they came to my Internship. I had done an internship in GenAI and the project was very unique. They asked me what I did, what was my project (high level explanation followed by technical details), how was the experience, what learnings I got from it etc. They were impressed with the project idea and asked me what is the current status and how are they going to proceed with it (as I had completed my tenure there).

Challenge 2: A DSA question.

They then gave me a DSA question. It was:

Given a string, delete the minimum number of characters, such that the string becomes a Palindrome. Return this minimum number. You need not return the palindrome string, just the number is enough.

I suggested a two-pointer approach first, where I would just do `counter+= 2` when there is a mismatch of characters. I explained it well and wrote the code for it followed by the TC and SC. They were not very satisfied with the approach and gave me an edge case where this solution might fail.

It was like: a b a b d a.

Here if we compare b and d, then the solution just fails badly.

I acknowledged my mistake and asked for a couple of minutes to think of a different solution. After some time, I explained that two pointers might work, we just need to handle such cases. So maybe we can try all ways → that's recursion. I developed an approach quickly with the TC and SC.

I then drew a recursion tree and did a dry run. He seemed satisfied with the response. I was about to write the code but he said, it's okay no problem, we understand the approach, let's move forward.

I was somewhat disappointed in the back of my mind about the question but I tried to focus on what's coming.

Next they asked me about my projects. They went really in-depth about every project both from a technical and a business perspective. They also asked about the challenges that I faced in these projects and how I overcame them. So please be ready to answer everything, the how, why, what, when EVERYTHING!

I had links to the Github Repos of all the projects, and they were quite happy to see that. They also asked me whether any of these projects are deployed. One of them was and they opened it. I had deployed my best project and it was also the 1st one in my resume. They opened it, and they were quite satisfied with the UI and initial appearance of the application.

Then, bhaai, they tested almost all the features of the application. I prayed to god, please make everything work (haha). They were happy to see that everything was working (though slightly buggy) but they were quite impressed with the project. See make sure if you have deployed something, test everything before your interviews begin. This was a rare case that they checked everything, so be prepared for this too.

At this point, the Interview was going very well and I was very happy.

After this, the female panelist started asking some HR questions like, have you worked in a team? How was the experience? What will you do where there is a conflict in the team? What if you don't like your seniors' approach and you think you have a better way? Some scenarios were also given to me.

She was quite impressed with the way I answered the questions with a decent structure and my overall way of speaking and body language.

Some more questions on my projects were asked.

The Interview then concluded with the Interviewers asking me if I have any questions for them. I had prepared some questions so I asked them.

1. How is Baker Hughes as an Energy Tech Company using AI? How is AI helping? Any specific projects on which AI is being used?
2. How has Baker Hughes contributed to your personal and professional growth?

We had a healthy discussion on both the questions for some time.

Overall the Interview lasted about 50 mins I think.

3. **[Oncampus F2F Interview: Techno HR Round]** [15 candidates appeared for this round]

As my round 1 ended, within 10-15 mins I was immediately called for round 2. I WAS SO HAPPY !

I entered the room, and to my surprise, there was only 1 panelist and she was the HR I think. Again it started warm greeting and a welcome from her side. She asked me how am I doing, how my day was going and all.

The Interview started with the introduction of course. Here I gave the HR introduction.

For the HR introduction, make it less technical overall.

Like:

1. Your background before SPIT
2. Technical skills but highlight them on a higher level
3. Add your internship learnings than the technical details
4. Finally, blend in your hobbies at the end.

Like I did: “when I am not coding or working on my tech projects, you can find me”

She complimented me on my introduction!

She started asking if I have worked in a team, how was the team, were there any conflicts, how did I resolve them, what was my role in the team etc.

Then she gave me a situation: ‘Imagine you are working in a team and you are the lead. Now one of your teammates is intentionally not working at the speed which was required, you have to deliver the project to the client tomorrow morning. So you have 1 night, what will you do? How will you handle your team, the client and that one teammate?’

Make sure that you have at least some prep to answer such questions. Like I started by highlighting the fact that project is the most important thing here, so I will start by communicating with the team-mate and understand his position and why he is not working. Is there any way I can help him? etc.

Just ensure that you think of some different answers or ways than the most obvious ones.

We had a good discussion on this question.

Then since my Internship and projects had a lot of AI, she asked me: ‘According to your knowledge about AI from your Internship and projects and your knowledge about Baker Hughes, where do you think Baker Hughes might be using AI?’

I asked the exact question in the previous round, so I smartly blended their answer and added some points of my own. She was quite satisfied with my response.

She then asked me why I want to join Baker Hughes, and I prepared an answer for this too so I gave that.

The Interview ended with me asking her the same question I asked in the previous interview.

Overall, I would say my experience in this interview was very positive. I was very happy when I came out and honestly relieved too.

Interview lasted for a good 30 mins I think!

Out of the 15 candidates, 9 were selected and I was one of them!!

Useful Tips:

1. **Know your Resume INSIDE OUT:** Make sure you have at least some idea about each and every word written on your resume. Please don't write anything that you have no idea about, it will create a very bad impression
2. **DSA is Important:** Though I was not asked about complex DSA, it is always good to be prepared about anything and everything. I started my DSA (leetcode) prep after my 2nd year ended, and I followed Striver's A2Z DSA course for it. Though it prepared me for all sorts of patterns and topics, I still lacked the intuition. I can solve questions when they are related to some patterns, but it takes a fairly large amount of time to decode the problem when it is something completely new. Therefore, I feel you should have both Intuition and Pattern recognition. I will suggest starting with Leetcode daily questions to build your intuition starting from your 3rd sem. Gradually from there, transition into topics and their questions and then start with the sheet. This will make sure you have both the Intuition and Pattern Recognition.
3. **Internship experience adds value:** My interview had good questions about my internship. It's important to clearly explain what you worked on, what you learnt and what impact you had.
4. **Build Projects that have some value:** Do not build generic projects, try to see what real-world problems can you solve and try to solve that in your projects. It may not be perfect, but is still way better than something too generic.
5. **Communication is super important:** See I have some friends who have a great technical profile but are rejected because of their soft skills. You may be a genius, but if you can't make the world aware about it, then what's the point? Hence try to focus on being vocal about your thought process, maintain good eye contact, a sincere smile, practice articulating your thoughts well, don't speak too fast or too slow or too vague. Take pauses wherever required, try to structure your answers.

THAT'S IT, there's no Rocket Science in it! If possible and time permits, try to do a couple of mock Interviews, it will greatly help.

6. **Consistency and Discipline over EVERYTHING:** Whatever you do, stay consistent with it. I remember, when starting out, I used to get anxious when I couldn't solve a problem, but with time and effort, I did manage to solve those.
7. **Sometimes, it's not your fault:** See, you are about to have a completely new experience in your life. **There will be times when things will just not work out**, no matter how much effort you put in, something undesirable will happen. **It is 60% skills and 40% LUCK according to me!**

I lost opportunities in MSCI, UBS because the test platform had some issues. I lost Barclays. I lost IDFC First Bank because I was asked something that was not in my knowledge and I got anxious answering that (that's a different story altogether haha)

Then I had prepared for Hyperverge so well, I spent almost 2-2.5 days, still was not shortlisted.

It is what it is!

These are the times you should stay calm, trust your efforts, spend time with your loved ones, trust whichever god you believe in. Don't take too much stress, don't let it take a toll on your health.

Trust me on this,

Jab nahi hona hota toh kuch bhi karlo nahi hota

BUT JAB HONA HOTA HAIN TOH KUCH BHI KARLO, HOKAR HI REHTA HAIN.

Because sometimes, all your plans fail, because of **GOD's PLAN!**

THERE'S AN OFFER WAITING FOR EACH AND EVERY ONE OF YOU!

If there's anything you would like to ask me in particular, aaram se reach out to me on my [LinkedIn](#)

All the best for your Placements 🙌 🙌

P. S.

Some Resources:

1. **DSA:** Follow [Striver's A2Z DSA Sheet](#) – it's structured, beginner-friendly, and covers all essential topics and patterns. Do some daily questions before starting this (as mentioned above)
2. **SQL:** Practice from [LeetCode's Top 50 SQL Questions](#) – great for query writing and real interview problems.
3. **DBMS:** Watch this [DBMS video](#) – it covers everything you need for interviews.
4. **Core Subjects (OS, CN, OOPs):** Refer to GeeksforGeeks – it's sufficient for brushing up on the most asked concepts in interviews.

You may also refer:

[Kunal Kushwaha for Java OOPs](#) if you have time.

[Networks Cheatsheet by Love Babbar](#) (covers almost everything in CN plus mostly asked questions)

[OS in one video by Anuj Bhaiya](#)

5. **System Design:** Go through [System Design Article](#).

Tip: You can skim through it and skip advanced topics like Kafka.

6. Tech Cheatsheet: [View the Cheatsheet here](#), I got this from my senior — it includes useful resources across key topics. Feel free to use and share!
