

Company: Baker Hughes

Job Profile: Digital Technology Intern

Offer Type: Internship + Placement

Internship Stipend: 40k

CTC: 11 lpa

Location: Mumbai (Powai/Airoli)

Process Date: Pre Placement Talk + Online Assessment - 11th August

Digital Interview - 12th August

Interviews - 14th August

Placement Process:

Eligibility criteria was 6.5+ CGPA , all branches were allowed.

1. **Online Assessment** [165 Students appeared for this round]

- Platform - Microsoft forms (proctored)
- Time - 30mins
- Questions - 25 questions

OA consisted of MCQs based on topics like **DBMS, CCN, OS, OOPS, DSA, Cloud Computing**, Programming questions (guess the output type) in **Python, Java**. There were a few **Quantitative aptitude** questions (work and time, pipe and tank, basic math questions, etc) and **Verbal questions** (antonyms, synonyms, phrases)

These questions were relatively easy. Time management is key here, dont be stuck on any question for too long. I myself ended up guessing 5-6 questions since there was no negative marking. I suggest preparing for CS fundamentals a month prior to placements and having handy notes to revise whenever required. It may get exhausting studying the same concepts over and over again but trust me it's worth it.

I didn't expect to get selected because I wasn't able to answer a few questions on cloud computing. But luckily got shortlisted for the next round.

2. **Digital Interview** [45 students were shortlisted for this round]

- Platform - HireVue
- Questions - 6 HR-behaviorial questions
- Time - a maximum of 3 mins per question

We received the shortlist around 8pm the same day and were supposed to finish our digital interviews before 3pm the next day. They have been repeating the same set of questions for the last 3 years now, so there's high chances they will repeat the same.

Questions were as follows:

1. Why did you choose your current degree program?
2. What do you aim to gain from this internship?
3. Tell us about a challenging project experience.
4. How did you manage multiple priorities and time?
5. Tell us about a time when you realized you have a weakness and how did you try to overcome that?
6. What'd you like us to know more about you?

I had prepared a couple of points that I would like to mention for each of these questions, but not an entire script. I suggest being as natural as possible throughout the interview and staying confident. It is okay if you fumble a little — just be confident enough to recover from it and don't let it affect your overall presence.

A few important tips:

1. Wear formal attire.
2. Sit in a quiet, secluded room with no disturbances.
3. Use headphones to ensure good sound quality.

3. **Technical Interview** [35 students appeared for this round]

My interview lasted for approximately 40 minutes. I had two interviewers on my panel: a Product Manager and a Data Scientist at Baker Hughes. The interview began with greetings and some small talk about the heavy rains that day. After that, they asked me to introduce myself. This wasn't something I had scripted; I just had an outline in mind of what I wanted to cover. My suggestion here would be to mention things you are very confident about, as the first few questions are usually follow-ups to your introduction. You are the one who decides the flow of the interview so answer thoughtfully and only discuss topics you know inside out.

In my case, I mentioned my Smart India Hackathon win, a few other hackathons, and the conference paper I had published. They then asked me several technical questions about my SIH project, including explaining the entire system architecture and data flow.

A couple of my projects involved LLMs, so they asked me to explain how transformers work. Since I had studied this thoroughly, I spent a good amount of time explaining it in detail I explained the architecture starting with the encoder-decoder structure, the role of embeddings. I went over the concept of self-attention—how queries, keys, and values interact to determine contextual importance for each token—and explained multi-head attention, layer normalization, and feedforward layers, using ChatGPT as an example to make it more relatable. One of the interviewers was well-acquainted with transformer models and its working, so he actively asked me “why” and “how” questions about each layer, which made the discussion engaging.

After that, they moved on to basic Python questions, such as the difference between arrays, sets, and lists, and asked me to give examples of when I would use each. They then shifted to OOPS concepts—asking me the difference between object-oriented programming and procedural programming. I couldn't give a very detailed explanation but provided a brief overview, which seemed to satisfy them. They also asked me to explain what OOPS is and why it is needed, which was a straightforward question.

The last 5 mins of my interview were around discussing my internships, my contribution in each and also my leadership experience as the Vice Chair of IEEE-SPIT – This part felt more like a friendly conversation than a formal interview.

4. **HR Interview** [15 students appeared for this round]

I was called for the HR interview immediately after my first interview. It was quite short, lasting no more than 15 minutes. The HR interviewer asked me to introduce myself and then asked a few questions about my projects. After that, she moved on to situational questions:

1. *What would you do if a client disapproved of a project you had been working on for months and asked you to redo it?*
2. *What would you do if you were at a hackathon and your project didn't work during the final demo?*

My biggest advice here is to carefully understand the question and, if possible, relate it to a past experience. For example, I had gone through a situation similar to the second question, so it was easy for me to relate to it and explain my thought process.

Overall, my HR interview went really well—it didn't feel like an interview at all, but more like a conversation. The key is to stay calm and confident, and most importantly, be yourself. They are not looking for textbook answers; they want authentic, personal responses. So be honest and answer with confidence.

9 students received the offer.

Useful tips/resources :

1. Firstly, placements are a lengthy process, and a lot of it is luck-based, so don't lose hope and always keep pushing for the next opportunity. There will be one company where your skills match, and your luck will shine as well, so always be at your A-game and don't miss any opportunities.

Don't be disheartened by rejections, there are better opportunities waiting for you.

2. **KNOW YOUR RESUME INSIDE OUT** – I cannot stress this enough. It is absolutely crucial to know every single word you have mentioned on your resume. Please do not lie on it—having a smaller set of skills that you know thoroughly is far better than listing 20 skills that you only know at a surface level.
3. Also, be thorough with your projects: understand how they work, the challenges you faced, and why you chose that particular tech stack.
4. Find a DSA sheet that works for you and just start with it—don't spend too much time looking for the “right material,” because there isn't one. Just pick something and start solving it consistently. I started focusing dedicatedly on DSA in sem 6, and that was quite late, to be honest, so I suggest starting a little earlier.

I used [neetcode](#) (majorly) and [striver's sheet](#) (when I wasn't very confident about a topic and wanted more practice) . I didn't have the time to solve every single question but i tried to cover as many topics as i could)

5. Solve aptitude questions from [indiabix](#).
6. Understand and practice OOPS questions and its applications since it's a very commonly asked topic.
7. Understand topics well enough that you can teach them to anyone. Use active recall since that really helped me.
8. Try to maintain a good CGPA (preferably above 8. But a minimum of 7.5) mine was 7.77 and I did regret not having a better CGPA.
9. If you're from EXTC, there are already a few companies you won't be eligible for, so be prepared for that and don't get discouraged too quickly.
