

Nitish Sharma

Computer Engineering

Company: **Barclays**

Job Profile: **Summer Intern 2025**

Offer Type: **Internship Only**

Internship Stipend: **75000/month**

CTC:

Location: **Pune, Maharashtra**

Process Date: **12/09/2024**

Placement Process:

1. **Online Assessment** (Out of all who appeared, 27 were selected for next round)

This was an online test conducted at college consisting of 14 questions. Among these, one was a coding question that carried maximum weightage, one was an SQL and rest 13 focused on CS fundamentals with a significant emphasis on DBMS and OOPS.

To prepare for this round, I thoroughly revised the concepts of OOPS, DBMS, CN, OS and DSA. I practiced DSA problems on Leetcode and also participated in many contests.

2. **Technical Interview** (Out of 27 students who appeared, 15 were selected for next round)

This round lasted for about 25-30 minutes. The process began with the interviewer asking me to introduce myself, followed by a few questions related to my resume. Since I'm from Jammu and currently studying in Mumbai, they asked why I chose to come so far for my education. They also inquired about my interest in the IT sector and whether I genuinely wanted to pursue a career in this field. This was a brief conversation before the technical questions started.

Next, I was asked to explain one of the projects I had listed on my resume. I selected a project and went into detail about it. The interviewer asked why I chose specific technologies for the project (e.g., "Why did you use Next.js instead of React?"). They also wanted to understand the relevance of the project: whether it had any real-life application and if it was solving a real-world problem.

After that, we moved on to questions related to computer science fundamentals. I was given real-life scenarios and asked how I would solve certain problems. One question I remember was about withdrawing money from an ATM. The question was: *If money is debited from your account but not dispensed by the ATM, what could be the issue and how would you resolve it?*

Another technical question involved synchronizing two APIs: *If the result of the first API is used as input for the second, how would you avoid any errors or overlaps during this process?*. Then, the interviewer asked few questions on OOPS and DBMS.

To clear this round, it's important to be thoroughly prepared with your resume and solid in your understanding of computer science fundamentals.

2. **HR** [Out of 15 students who appeared, 13 were selected]

The interview started with the typical question: *"Introduce yourself."* After that, I was asked a series of behavioral and personal questions, including:

- *When did you take a position of responsibility? What challenges did you face, and how did you overcome them?*
- *How many members are there in your family? Do you often have conflicts with your siblings?*
- *Can you share an experience where you worked in a team, and there were differences in opinions? How did you resolve the conflict or handle clashes between your views and those of your team members?*

The interviewer also wanted to assess my general awareness and asked for my opinion on the current situation in Gaza and the Israel conflict. This round lasted around 20-25 minutes.

I wasn't fully prepared for this type of questioning, but I stayed honest and answered each question based on the **STAR (Situation, Task, Action, Result)** approach. It's crucial to stay calm and composed. Even if you don't have an immediate answer, take a moment to think it through and respond confidently.

That said, it's always a good idea to practice these types of questions beforehand with friends or family through mock interviews. This helps you prepare and handle such rounds more smoothly.

[13 students were offered the internship]

Useful Tips:

Be thorough with your resume. If you've mentioned something, ensure you can provide detailed answers if asked about it. Self-assess by asking yourself, "If I am asked this, will I be able to answer?"

Have in-depth knowledge of core subjects like DBMS, OOPS, OS, and Computer Networks (CN). Utilize various online resources such as Javatpoint and GeeksForGeeks.

Practice problems on platforms like LeetCode and GeeksForGeeks. You can follow structured preparation sheets like the Striver Sheet and participate in coding contests. This will help you develop skills to solve problems in a time-constrained environment.

For HR interviews, maintain confidence. It's beneficial to be prepared for common behavioral questions to help you respond effectively.
