

Tanish Kuldeep Patil

Computer Engineering

2022300128

Company:Blackrock

Job Profile:Global Marketing

Offer Type: Internship

Internship Stipend:50000

CTC: 18 LPA (Performance based PPO)

Location: Mumbai /Gurgaon

Process Date: 28/08/2025

Placement Process:

There were 3 rounds in this process. (For GM role)

1. Online assessment
2. Technical interview
3. HR round

1. Online Assessment[100 students appeared for this round]

This round was conducted on E-litmus platform and was proctored.

It consisted on mainly 3 sections and all were of objective type(mcqs):

1. Logical reasoning,verbal reasoning,aptitude
2. Coding / algorithms
3. DBMS and SQL

This was of 90 minutes, but each section and subsection had its own time limit set.

There were 4 subsections in 1st section, like verbal reasoning, logical reasoning, quantitative aptitude, and assertion reasoning type.All these subsections were easy to solve but lengthy, especially the quantitative aptitude one.Each sub section had its own time limit and navigation in subsection was not allowed, so had to carefully answer or leave the question. The questions were of cat-type basic aptitude and english questions, like speed and time, height and distance, work and efficiency, upstream and downstream, profit and loss, missing number or wrong number in the sequence.

The 2nd section had flowchart type questions based on an algorithm or a scenario like lottery system, shopping mart. It had 4-5 questions based on each scenario, so had 4-5 such scenarios and each flowchart had a missing box to fill for that algorithm. There were some loops based mathematical coding questions as well, like to test the divisibility by 17, what should be the main line :- first n-1 digits - 5* last digit should be divisible by 17. Then there were lengthy loop questions to calculate some mathematical sequences, like ap, gp, sum of squares.

The 3rd section was of dbms and sql and had queries and database concepts like normalization, acid properties. Major questions were output type questions to the queries, like sysdate from dual, to_char function, and many more based on dual.

In the OA, try not to spend more time on just 1 question, as it was very much time bound, especially the flowchart questions and quantitative aptitude.

2. **Technical Interview**[Nearly 35 were selected for this round (7 waitlist)]

I was selected for the Global Marketing role which had 7 shortlists (3 waitlists). This round started with my introduction and the interviewer asked me to go through my projects. I mentioned about my film recommendation project, on which the 2 panelists asked me to explain its architecture, how will I expand the project to industrial level, which tech stack I used, and why so. Later, they asked me to explain about data collection and preprocessing at industrial level.

That was it, I felt that I stumbled upon some questions based on the architecture. 3 students cleared this round and went to the hr round.

3. **HR**[16 total shortlists- 3 for GM role] (Technical interview-II ,HR for GM role)

It started with my introduction, followed by my projects. HR later asked me some questions like:

1. What do I think about the use of AI and its extent in next 5 years?
2. Does AI make you lazy?
3. Where do you see yourself in next 5 years?
4. What are your weakness and what plan do you have to improve those aspects?
5. Few questions about BlackRock as a company and what does it do?

Total of 10 students were selected overall. 2 for Global marketing role.

Useful Tips:

I wanted to share some of my thoughts after going through the interview process with companies like Baker Hughes, Dolat Capital, Quantiphy, and BlackRock. My main interest has always been in mathematical coding, and mathematical problems solving (which was thoroughly asked in dolat capital) rather than traditional DSA, so it was a surprise when my journey led me to a global marketing role.

What really struck me across all the interviews was that confidence is a huge part of the game. The interviewers valued direct and clear answers, and how you present your thought process seems just as important as the final solution. They almost always threw in a couple of really tricky questions that felt designed to see how you handle pressure. Honestly, getting through one of those tough problems gives you a major boost and makes the rest of the interview feel much more manageable.

A major wake-up call for me was in the Dolat Capital interview when they started asking deep questions about C++, which was definitely not my strong part. It taught me what I now call the "30% rule": even for your weakest subjects, try to have at least a basic, 30% level of understanding. It's far better than being caught completely off guard. Similarly, the BlackRock interview was an eye-opener. They did a deep dive into my project's architecture, asking about the data preprocessing pipeline and my storage choices. It made me realize that interviewers want to see that you can think about the entire system, not just the code you wrote.

In these 4 interviews, the common question was on my project. They told me to go through my projects and ask deeply on that one.

First, only list projects you are 100% confident you can defend, because they will ask tough, detailed questions. Second, be careful about listing an outlier tech stack. If one project uses a technology that doesn't fit the rest of your story, interviewers will zoom in on it. Your projects should highlight your strengths, not create traps.

So, while my path took an unexpected turn, the technical interview process itself was an incredible learning experience. The biggest lesson was the importance of a balanced strategy: know your strengths, strategically cover your weaknesses, and always be ready to explain your thinking with confidence.
