

Muskan Sharma

Computer
Engineering

Company: General Mills

Job Profile: Summer Internship

Offer Type: Internship Only

Internship Stipend: Rs. 35k/month

CTC: -

Location: Mumbai, Maharashtra, India

Process Date: 14/09/2024

Placement Process:

1. **Online Assessment** [About 150 students sat for the test]

This was an online MCQ test with a time duration of 1 hour 15 minutes. It had 3 sections- Logical Reasoning, English and Computer Theory. Each of these sections had individual timers. Logical reasoning had 15 questions with 15 minutes for the same, same for English, while Computer had 30 minutes for 30 questions. Questions in Logical reasoning were easy, although some were lengthy. As the question paper has no negative marking, I would suggest applicants to blind attempt the unattempted at the last minute for any additional stroke of luck.

Logical reasoning had questions like blood relations, ordering between people, solving a set of instructions to get output, pattern detection etc.

English was fairly easy, mainly with sentence ordering, and grammar correction type questions. Vocabulary was easy as well. For computer, CCN and OS, algorithm types questions were asked. Half were easy to recall, some were more difficult. A standard algo question would ask which mcq fits the missing part of algo, etc. DSA questions were easy, basically a dry run of how the mentioned data structure would look like at the end if a given set of inputs were fed into it.

One important topic that had 5+ questions was the different topologies and technologies in computer networks (router, hub, switch, mesh topology, etc.) Students are recommended to learn their individual functions and advantages.

2. **Technical Interview** [18 candidates were shortlisted for this round]

My tech interview went for 45 minutes-1 hour, and every aspect of my resume was asked, and they also put some HR questions in between. I was asked really basic questions like reversing a number or finding if the string was a palindrome. I was asked about the theory of individual data structures and their real life applications. In DBMS, they asked to explain ACID properties, especially atomicity, and the difference between SQL and NoSQL. They drew a table and asked me 2 queries for such. I remembered the logic but not the syntax, so they allowed me to explain the logic to them. I was also given another table and asked how it could be simplified (basically normalization).

From my projects listed, I was asked the flow, the planning and asked to explain about the project and technologies in depth. Based on my committee and project experience, I was asked about conflict resolution, how I mediated issues, leadership examples, etc.

Some panels would ask my peers on the sections (DSA, dev, etc) they were most comfortable with, while mine asked for everything.

3. **HR Interview** [10 candidates appeared for this round]

This round went for 20-25 minutes. I had ideathon listed on my resume, so I was asked about that PS and my ideation for it. Based on that, they asked for an ideation for a random problem. I could not come up with anything, so I explained how tech could only be used for better awareness, and cited a documentary I had watched over a similar topic. I was once again asked about conflict handling and how I would deal with, and have dealt with disrespectful junior, senior and same aged colleagues. I was asked about my family, my role model, and my hobbies to fill in my pastime. I mentioned reading books, and named the last book I read, and was asked what conclusion I drew from it. I was asked about how I think people would describe me, and if I have any negative qualities.

4 students were selected for the internship.

Useful Tips:

- For the OA, revise network devices and topologies, and practice some logical reasoning questions for better time management. Might be a good idea to brush up some incorrect grammar detection questions.
- Be thorough with your resume. Highlight your committee and other group experiences, if any. Your tech stack need not be bulky, but you should be thorough with it.
- Learn about ACID properties, and why they matter. Brush up on normalization and SQL queries.
- Some panels asked graph trees questions too, so be good with knowledge and logic flow of easy questions of those, even if you don't remember the syntax.
