

Company: IDfy

Job Profile: SDE

Offer Type: Internship + Placement

Internship Stipend: 25k

CTC: 10 LPA

Location: Andheri, Mumbai

Process Date:

- OA : 11th August, 2025
- Interview : 12th August, 2025

Placement Process:

Before the OA, only students belonging to CE or CSE branch and having CGPA 7.5 and above were shortlisted for the OA, so a significant number of students were in-eligible to apply.

SO PLEASE MAKE SURE TO MAINTAIN GOOD CGPA. (AT LEAST 8)

Pay attention in PPT and interact with the company employees so that they remember you.

1. Online Assessment

Around 66 students appeared for the test, since IDfy had come for two roles (SE and ML) ,there were two different tests, one for SE and other for ML (students had to choose a role before giving the OA).

The test for SE was conducted on Hackerrank for 90 minutes, and everything was proctored. The test consisted of 3 sections having 1 DSA, 2 SQL , 2 REST API questions respectively.

Every candidate did not get the same DSA question, I had got an easy one. The question was to check whether a password was strong or weak, for the password to be weak there were certain conditions that had to be satisfied like “contains only lowercase or uppercase letters” or “contains only numericals” or “contains a substring which is present in banned_words list”. The constraints were also not very big so brute force worked here, just remember to put the words present in banned_words list in a set for fast lookup otherwise certain test cases won’t pass due to TLE. Since this question was easy, I finished solving this question in 10 minutes.

Next was the SQL section, this section was tough and this is the game changing section because very few people know SQL very well so solving this section completely will definitely give you an edge over others. Both SQL questions had multiple tables, so I don't remember the exact questions, the first question could be solved by join and using group by and aggregate function. The second question was a notch above the first one, this question involved multiple joins and we had to use subquerier to further process the table before joining with other tables (eg : adding a new column of data) . The inner queries further contained aggregate and group by clauses, so this can become overwhelming to understand the exact flow, the trick here was to use WITH clause to separate out the inner query logic to make the query more readable and understandable. This section took most time because of the complexity involved. Since I had quickly solved the DSA question, I could devote more time to this section.

PLEASE TAKE SQL SERIOUSLY, IT SEEMS EASY UNTIL IT ISN'T, SO PRACTISING SQL IS VERY IMPORTANT.

Leetcode SQL 50, CodeChef, Hackerrank, are some of the good resources to start with. A day prior to the OA I practised from [this](#) site to brush up my SQL knowledge.

Next was the REST API section, each question instructed us to create a get method using any language like C, C++, Java, JavaScript (Node JS) , Python etc and hit a URL to get data and apply the given filter and return the filtered data. But the catch was, we had to do it from scratch, no framework, no code autocomplete, no external help, so knowing the exact syntax was the key here. I knew how to make a REST API in Java using Spring Boot Framework but I had no idea how to create the Get method from scratch in Java and since most of time had gone in SQL section, I did not have time to think about the syntax in JavaScript, so I could not solve both REST API question.

Since I had solved the DSA and SQL section completely I got shortlisted for the interview but some of the other shortlisted candidates had solved some sections partially. But to remain on the safe side, try to solve all questions, even partial is enough **SOMETIMES**, not every time.

I feel clearing the OA is the toughest task because of the competition and time pressure. I was fortunate enough to have only 66 students for the OA, other times I had to compete with 100+ students, so focus on getting proficient in DSA, SQL , Computer Fundamentals and Aptitude. I had given the OA of 5-6 companies before IDfy and cleared the OA of only 3-4 of them because I couldn't solve a DSA question fully or due to aptitude, so please focus on them early on.

2. Technical Round

Only 8 out of 66 candidates were shortlisted for the interview round. The shortlist came at 7:30 pm a day before the interview and we also had Baker Hughes PPT and test a day before the interview, so I did not have much time to prepare for the interview. Since I had read previous year interview experience, I focused on the projects listed on my resume, like tech stack, features, architecture diagrams etc.

We had to arrive by 9 am. There were three panels. I was first in my panel, my interview started around 10:30 am. So my interview started with the interviewer downloading the results of OA. He saw my results and said that I had the highest score so he was impressed by it. Then he introduced himself and his role at IDfy (**he also asked some points from the PPT, so remember to pay attention in the PPT**), then he read my resume, each and every point, then he told me to introduce myself. I mentioned my education background, a short description about my projects, and my interests (**prepare a good 1-2 min introduction beforehand, use chatgpt or other AI tools to refine it**). I had mentioned Formula 1 as one of my favourite sports to watch, fortunately my interviewer was also a formula 1 fan so we had a good brief conversation about the sport. Then the interviewer said that he would focus on three sections of my resume, technical skills, projects and internships. He started with a question, in which programming language was I most comfortable in and how would I rate myself in that language. I mentioned Java. He then started with Oops in Java, he asked me about polymorphism, diamond problem, how interfaces solve the diamond problem, static keyword, how static variables and static methods are different from each other. I answered all these questions correctly and gave examples where ever needed to explain the concept. Then he asked me to write the code for Destructor in Java. I was unsure whether Destructor existed in Java, so I mentioned this at the start but since I was unsure, I thought for a while and said that, to implement a Destructor we have to make the object null so that Garbage Collector will destroy the object. The interviewer said that my initial answer was correct that Destructor did not in Java, so he told me to have more confidence in my answer (**honestly I did panic a little after this so I drank water to calm myself**), after this he gave me a DSA question to solve, the question was there are a list of transactions given , the format was same as the ones given in a passbook , so there was a transaction description, credit amount, debit amount and current balance. Initial balance was given and we had to flag any transactions which are erroneous, the transaction was erroneous when current balance was not correct. For example, if the initial balance was 100 , credit was 10 , so the current balance should be 110 , if it was otherwise then we will flag this transaction as wrong. This was an easy question, simple math was required, only thing required were string functions like split, parseInt to get data from string. First, I verbally explained my approach then proceeded to write the code on paper (**remember to write clean and readable code**). Once this was done the interviewer proceeded with SQL queries, he gave me two schemas, Employee and Department. He asked three queries, I don't remember exact questions but I had used joins,

group by and aggregate functions to solve them (**remember to think clearly, ask for time to think and break down the problem, then join the solutions**)

Next, the interviewer asked which was my favourite project, he read the project description. I had mentioned JWT, so he started by asking what is JWT and describe its structure, how did I implement it in my project, then he asked about REST APIs, difference between get, put , and post, whether we can create a new entry in db using get request (**we can by sending the data as path variable or query parameter, but its not a good practise**).

Then he said he was done with the interview and asked whether I had any questions. I asked two questions and the interview ended, my interview lasted for around 50-60 minutes.

After finishing my interview, I was instructed by our TPO to wait for the results till 1 pm. We initially thought that we would have to wait for another round at least, but then the company official said that no more rounds will be taken and final results will be announced on the basis of the first interview round. Two of the candidates had a second interview round but I did not.

Around 3:30pm, the results were announced, a total of 5 candidates were selected and fortunately I was one of them.

Additional Tips and Resources:

- **Placements are tough, remember to stay calm, and patient. I was so disappointed with myself when I could not even crack the first round of many companies that I started to self-doubt myself. Keep your head down, and keep grinding.**
- **Luck definitely plays a part in placements, so focus on what you can control which is skills. Remember consistency is key, whether it's DSA or academics. I had a good CGPA, but since I was not consistent enough in DSA so I could not crack other high paying companies.**
- **Have good projects, and remember to justify specific things about the project, like tech stack, architecture etc.**
- **If you are familiar with Java, then master it, if not, at least know the basics like OOP concepts.**
- **I did not give a single HR Round, so I don't have any experience in that, but prepare for HR Round because it can happen that you clear all technical rounds but fail to clear the HR Round.**
- **Practice giving answers in front of a mirror or give mock interviews to your friends, this improves your communication skills.**
- **Follow Striver's sheet for DSA, give contests on leetcode, codechef, codeforces, this helps because you get a habit of solving questions with time pressure.**

- Aptitude is very important, a lot of companies ask in OA, use [this](#). Practise timed tests to really mimic the test environment. I started aptitude late, don't make this mistake.
- Puzzles are a common way to test critical thinking in interviews so practise from [GeeksForGeeks](#).
- System design is a common question in interviews even for freshers so practise from [GeeksForGeeks](#). Use chatgpt to understand the specific terminologies, and practise questions like how to scale a specific system (for example your projects).
- [Guesstimates](#) can also be asked, so prepare them if required (this should be done only when you have ample amount of time).
- During interviews, maintain eye contact while answering, be calm and ask for help if required, interviewers don't mind giving hints, they want to know your thought process.
- Remember to fill all the required application forms while applying, companies are strict and don't accept any excuses for any delay or missing application details. I missed filling one registration form while applying for IDFC First Bank, so I could not even give its' OA. Don't make this mistake.
- A lot of companies also hire through hackathons like Nomura, JPMC, Morgan Stanley, Adobe etc so keep an eye on them and practise development side by side.
