

Rashi Lodha

Software Testing Engineer

Company: ISS Stoxx

Job Profile: Software Testing Engineer

Offer Type: Internship + Placement

Internship Stipend: 60k

CTC: 14 lpa

Location: Mumbai

Process Date: 5 August 2025

Placement Process:

There were a total of 3 rounds :

OA

Tech Interview Round

HR round

They were all conducted on the same day - 5/08/25. Initially the criteria was 8.5 cgpa but then it was reduced to 7.5 cgpa. Preplacement talk was conducted on 4/08/25 at 5:00 pm. Make sure you pay attention to the PPT as it will help you to ask good questions to the interviewers. If you can't think of any good questions, take screenshots during the PPT if it is online and then you ask chatgpt to give some good and unique questions.

1. **Online Assessment** [Around 150]

The OA consisted of four sections and it was taken on Google Form and there were a total of 70 Mcq questions to be done in 90 minutes. 1 mark was awarded for every correct question and 0.25 marks were deducted for every wrong answer.

Java (18 questions)

The questions were mostly based on guess the output on topics which included multithreading, OOPS, enum, access modifiers, collection frameworks, interfaces, streams. Though my primary language was C++ and I knew the basics of Java, I thoroughly prepared for OOPs and a few advanced topics of Java . I tried to guess the output questions based on java from multiple sources on the internet.

Python(17 questions)

The questions were based on topics like **lists comprehension, stacks, OOPs, shallow and deep copies** and on basic concepts. I prepared for python in a day and tried to solve as many questions as I could from the internet.

SQL(5 questions)

There were queries based on **Group by, Where, Joins, Order by** and **Delete**. The options were very close to each other so read it carefully.

Aptitude (30 questions)

The questions were based on topics like stocks, profit-loss, train problems, probability, permutation-combination, boat-stream problems, speed-distance.

Tips

So for **Aptitude** I was left with only 32-35 mins as I spent much time in java and python and also started 10 mins late so I tried to solve only those questions that were easy in the first go and skipped the ones which I thought might be time consuming. So I would advise you to first just solve those questions which are easy and not waste your time solving the difficult ones as there might be questions ahead which can be solved in seconds and due to time constraints you might miss them.

For **Java**, prepare in depth and have a good understanding of java and do practice as many guess the output questions as possible.

2. [Techincal Round] [45 students (8 students in Testing)]

My interview began with the interviewer asking if my primary programming languages were Java and Python. I clarified that my strengths lie in Java and C++, and that I am not very well-versed in Python. This led to the follow-up question, “Then how did you clear the Python test in the morning?”

I answered honestly, explaining that I had researched the company’s past interview patterns on Google and found that Python was frequently used in their tests. So, I prepared for it in advance—just enough to clear the assessment—while still having only a basic understanding of the language. I also mentioned that certain programming concepts, such as object-oriented programming (OOP), are similar across Java, C++, and Python.

He then asked me to elaborate on these similarities. I spoke about OOP concepts like encapsulation, polymorphism, overloading, and overriding. The conversation shifted to access modifiers, where I initially forgot to mention “default” but quickly remembered and explained all four in detail.

Next, he asked questions about my projects. Since two of my projects were built using Flutter with Firebase, he wanted to know why I chose Flutter as my tech stack and why Firebase was my database of choice. He also asked why I didn’t use React Native, given its similarities to Flutter. I realized the importance of being ready to justify tech stack decisions, so I explained my reasoning clearly.

He then moved to my third project, which was based on the MERN stack. Here, he asked why I used MongoDB, what specific problem my project was solving, and why I chose React. He also asked me to explain JWT authentication. So I explained its three parts in detail and he asked me scenarios like handling invalid tokens.

From there, the questions expanded to cookies—what they are, how they work, and how I implemented them in my project. Since my project also used WebSocket, he asked a few technical questions on that as well. I noticed a pattern: most of his questions were based on what I had mentioned in my answers, which made me realize the importance of only bringing up topics I could discuss confidently.

The technical section also included a DSA question based on strings. The problem was to count the number of words that are the same in a given substring. Initially, I was a little confused because of the word “substring,” so I asked for an example to clarify. Once I understood, I confirmed my approach with him, then provided a HashMap-based solution, which he approved. I wrote the solution in C++ on paper, and he later asked me to traverse the map in a different way, which I did successfully.

He then tested my database knowledge by asking which databases I was familiar with. I mentioned SQL, MongoDB, and Firebase. This led to an SQL query question involving two tables with a common attribute **id**. He wanted me to update the **category** column in table1 with values **xyz** only for rows where the **id** was present in both tables. My first query was a bit complex, so he asked me to simplify it, which I managed to do.

He also asked HTTP status codes and basic API concepts—first the full form of API, then how it works.

At one point, he paused the technical discussion and invited me to ask questions. I asked about the merger between ISS and STOXX and how it affected the company. He explained and then he mentioned that now they are shifting from Angular to React. I followed up by asking why that shift was made. I also asked a question related to the testing role, which he answered in detail.

After the short break, he asked about my favorite subject in 12th grade. I said Chemistry, so he asked basic questions like the symbol for water, what happens when hydrogen is added to water, and symbols for nitrogen and nitrogen oxide.

The topic then moved to testing. I explained the two types—manual and automation—and further broke them down into functional and non-functional testing. When asked if I had ever done testing, I shared an example: during my curriculum, I cloned a banking website from GitHub and ran various test cases, including edge cases. He then asked about the Software Development Life Cycle (SDLC), which I couldn't answer so he gave me a brief explanation.

Since testing was my second preference, he asked if I was genuinely interested in it. I reassured him that I was, stating that I am equally interested in testing and development, though I am not looking to work in machine learning or data roles at this point.

Before wrapping up, he also asked where I live and about my family background.

Tips

One key takeaway was that the interviewer often picked questions based on what I said, so it's important to speak about things you can confidently explain in depth and you should be knowing your resume really well. Mention only those things in the resume which you know in detail and if you are adding any project from github you should know it in and out. If you have chosen **Testing** as your second preference make sure you prepare a proper justification for that and also make sure you have some basic understanding of Testing.

3. **[HR Round]** [15 students]

My interview started with me greeting them and they began to ask me where I live and then how much I scored in CET, JEE, SSC and my current CGPA.

Then they asked me what is testing and what are different types of testing. I explained whatever I knew in detail.

They were still not convinced since Testing was my second preference and questioned me that you have no project related to testing so is it that you are sure you want to do the role of **Testing Engineer**. I said Yes and gave them an explanation of whatever I could think of at that point of time. Then they asked how I decided to choose the Testing role but I told them that I don't know anyone who has knowledge about Testing so I googled about testing role and then I decided to take it.

But this was not the correct way of saying because it seems that an uninformed decision was taken so make sure you show them that you take decisions wisely and be prepared for giving such kind of explanation.

Then they asked me to go out and talk to my senior or professors about the testing role and what it is exactly and what a Testing Engineer exactly does. At this point I thought they would reject but I went out and Thanks to TPO that helped a lot to connect to me seniors of ISS Stoxx and they

explained me clearly and then I went to interviewer again after they were done taking others interviews and I explained them in detail whatever I understood and they also asked me who did I talk to and then I thanked them and left the room.

[12 students were offered the role including me]

Useful Tips:

The entire placement process can be very exhausting, so it's important not to lose hope and to keep working hard. Luck also plays a significant role, but hard work is something you can control—so give it your best shot.
