

Company: ICICI Lombard

Job Profile: Trainee Software Engineer

Offer Type: Placement Only

Internship Stipend: NA

CTC: 8,00,100 LPA (6,30,000 Fixed + 1,70,100 Performance Bonus)

Location: Mumbai

Process Dates:

- **18/12/2025:** Online Assessment (Online)
- **22/12/2025:** Interviews (Offline)

Placement Process:

This was the second time Lombard visited the campus.

There were 4 rounds for this process. It was announced that the recruitment process would include:

1. Online Assessment (OA).
2. 2 Technical Interviews.
3. HR Interview

1. **Aptitude and Technical Test** [90 mins]:

The first round was a comprehensive test that included aptitude, technical multiple-choice questions (MCQs), and coding. It was divided into 7 sections, and the total duration was 90 minutes. The first section was a coding question (DP) which was to be completed in 30 minutes. The other 6 sections were MCQ questions. The aptitude section was timed and non-navigable, meaning you can navigate between questions but once you exited this section, you couldn't return to it.

The remaining 6 sections covered topics like Database Management Systems (DBMS), Data Structures (DS), Computer Networks (CN), Object Oriented Programming (OOPS), Operating System (OS) and Aptitude.

2. **Technical Interview 1** [50-60 mins]:

This round was one of the main rounds of the interview process, lasting approximately 40–45 minutes. It primarily focused on my resume, core technical knowledge, and problem-solving approach.

a. Introduction & Resume Discussion

The interview began with a brief self-introduction, followed by an in-depth discussion of my resume. The interviewers focused on a project where I had implemented multi AI-agents. I was asked questions related to:

- What AI agents are
- Their implementation
- Their working mechanism
- The overall architecture and design decisions

b. System Architecture, AWS, Docker & Kafka

Since AWS, Kafka, and Docker were mentioned in one of my projects, the interviewers explored these topics in detail.

- I was asked to explain the complete architecture of the project.
- One of the interviewers then asked me to list and explain the AWS S3 and Docker commands I was familiar with.
- I was asked about the working of AWS Glue and AWS Athena, including how they are used for data crawling and querying.
- I was asked whether MongoDB can be set up using Docker, to which I answered yes.
- Following this, I was asked to explain all the commands required to set up MongoDB from scratch inside a Docker container, including container creation and configuration.

c. Authentication & Security (JWT)

The discussion then moved to authentication concepts, specifically:

- What is JWT?
- Access Tokens and Refresh Token
- Edge cases related to access and refresh token handling
- Differences between JWT-based authentication and session-based authentication

d. Object-Oriented Programming (OOPS)

Next, I was asked questions related to OOPS fundamentals, including:

- The four pillars of OOPS
- SOLID principles
- Inheritance and its different types

e. SQL & Database Concepts

The interviewers then covered basic SQL concepts, which included:

- Types of joins in SQL
- ACID properties
- Order of execution in SQL queries
- Writing a SQL query to filter duplicate rows from a table

f. Overall Experience

Overall, this was a relatively easy and well-structured round. The key takeaway is to:

- Be confident while explaining your projects and technical concepts
- Stay calm during problem-solving
- Clearly communicate your thought process, as the interviewers were more interested in understanding how I approach problems rather than just the final answer

3. Technical Round 2 [15-20 mins]:

a. Project Discussion

This was the easiest interview. The interviewer asked me to choose any one project that would impress him with my skills and explain it thoroughly. Then he asked follow-up questions on that, which also included a few questions on the tech stack mentioned for each project.

b. Internship & Achievements

He then moved on to the **Internship** section and **Achievements**. He asked about hackathons, including which project I made in which hackathon, what problems I faced, and how I tackled them.

For this round, you must have to know each and every feature of the project that you have mentioned, along with the tech stack you have mentioned.

4. HR Round [10-15 mins]:

The final round was a 10–15 minute interview. Make sure you are well prepared for generic HR questions.

The interviewer started with questions such as:

- Where do I belong from
- Where do I currently stay
- How many family members I have and what they do
- Why I am interested in an insurance firm

He then picked one of my projects and asked me to consider a scenario where users are ghosting the platform and how I would expand the business across geographies.

It was more of a conversation-based round aimed at assessing my mindset, thought process, and long-term goals.

5 students were offered the role and I was one of them !!!

Useful Tips:

The most important thing about placement season you need to understand is that there is a **large amount of luck involved**. You can increase your chances by practicing as much as possible, but in the end, you really need **good luck (only once)**.

- Be mindful of **time management**, especially during the **aptitude section**.
 - Stay calm and maintain focus, as the ability to navigate freely in technical sections can be both a **benefit and a distraction**.
 - Be confident when explaining your **projects and concepts**.
 - Review common questions related to your **resume and skills**.
 - Keep giving **mock interviews**, either **online or with friends**, to build confidence and improve your performance.
 - Maintain a **positive attitude**, smile, and stay composed throughout.
 - If you're unsure about something, it's okay to **pause and collect your thoughts before answering**.
 - **Just don't lose hope; patience is the key.**
