

Company: KPMG

Job Profile: Analyst – Tech Enablement

Offer Type: Internship + Placement

Internship Stipend: 20000 INR/ Month

CTC: 5 LPA Fixed + Variable (in hand) + Other Benefits +

Allowances (based on Location)

Location: Not disclosed yet

Process Date: 11th September 2025

Placement Process:

The selection process for the Analyst - Tech Enablement Role (KPMG 2nd Role) was officially announced on 3rd September 2025. Initially, it was mentioned that the process would include an Online Assessment (OA), followed by a Group Discussion, two Technical Rounds, and one HR Round. However, the Group Discussion round was later cancelled, and the process moved directly to the Technical Interviews after the Pre-Placement Talk. Our process took place online from college.

1. [Online Assessment Test] [About 20 candidates for second role only]

The Online Assessment (OA) was held on 8th September 2025 and was of easy to medium difficulty. It mainly focused on Quantitative Analysis, along with other aptitude-based questions. It consisted of 55 questions with 3 sections being Aptitude, Quantitative Analysis and Verbal Ability. The test was for 40 minutes only. It was proctored with camera access and full-screen mode enabled, ensuring a monitored and fair evaluation environment. Each question required proper calculations, logical thinking, and step-by-step solving; there were no simple one-word or direct MCQ-type questions. It required quick problem-solving skills as the time limit was quite tight. Both speed and accuracy played a crucial role in performing well in the assessment.

It was conveyed that those who applied for the first role and cleared the test of the first role were allowed to sit for the second round directly if they applied.

2. [Technical round 1] [14 candidates]

After the announcement, the process began with a brief online Pre-Placement Talk (PPT) conducted jointly with SPCE students (their offer and role were different). The session was quite informative, covering details about KPMG as an organisation, what the firm does, its service lines, work culture, and the type of work we would be involved in. They also explained that the role would include client interactions, analytical work,

and frequent travelling as part of on-site engagements.

Following the PPT, the Group Discussion round was skipped, and the process moved directly to the Technical Interviews. A total of 14 candidates were shortlisted and divided into two panels, with 7 candidates in each. The interviews were conducted online through Microsoft Teams, with each slot spaced approximately 20 minutes apart. The overall process was well-organised and smooth, giving candidates ample time to prepare between rounds.

I was the first candidate to be interviewed in my panel. The interviewer began the conversation in a friendly manner by asking how I was doing, which helped ease the initial nervousness. He then asked me to introduce myself, following which he requested me to give a brief overview of my work experiences.

Since I had three prior work experiences, including one at Amazon India, he showed particular interest in understanding the kind of projects I had worked on. He went in-depth about my responsibilities, the technologies I was introduced to, and how I managed and contributed to each project. We discussed the challenges I faced, the problem-solving approaches I used, and the overall learning outcomes from each role. My interview didn't follow the typical question-answer format; instead, it felt more like an engaging discussion about my experiences and professional journey. The interviewer seemed genuinely interested in understanding how I applied my knowledge in real-world scenarios, which made the interaction quite comfortable.

After discussing my work experiences, the interviewer moved on to ask about my academic background. He asked me what subjects I had learned during my computer engineering course and what I was currently exploring. I mentioned that I was learning about emerging technologies like Cloud Computing and Blockchain, which naturally led to a deeper conversation about new advancements in technology. He seemed interested and asked me which of the latest technologies fascinated me the most and why, along with a few related follow-up questions.

After that, he shifted the focus toward Computer Science fundamentals. He asked me about the different sorting algorithms I had explored and specifically questioned me on the difference between Bubble Sort and Merge Sort, discussing their time complexities and use cases. He also asked me to tell him the pseudo-code of the merge sort algorithm briefly.

He then moved to Data Structures and Algorithms (DSA), asking me to explain the fundamentals, such as stacks and queues, along with their real-life applications. For instance, he gave examples like the undo-redo functionality in applications and how it relates to stack operations. He also asked me some OOPs fundamentals as well but not so much in depth. The discussion was quite interactive, as he appreciated the logical reasoning behind my answers and encouraged me to explain concepts in my own words.

Towards the end of the interview, he asked me if I had any questions for him. I took the opportunity to ask about the key responsibilities I would have as an Analyst at KPMG and also inquired about the career growth opportunities within the organization. He seemed particularly impressed by the second question, appreciating my curiosity about long-term development. He then explained both aspects in great detail, describing the nature of the work, the kind of projects analysts are involved in, and the structured growth path within KPMG. It was an insightful conclusion to the interview and gave me a clearer understanding of the role and the organization's work culture. He then ended the interview. The interview was around 45 minutes, so he didn't get to ask much about my other skills. He didn't ask about my projects and all. Other candidates were asked some other basic CS fundamental questions, hobbies, projects and basic DSA.

3. **Technical round 2** [6 candidates]

6 candidates were divided into 2 panels again.

In the second round, the interviewer in my panel focused primarily on my projects rather than my internship experiences. He began by asking me to introduce myself, and then I briefly mentioned my internships. After that, he delved deeper into my latest projects, asking me about how I implemented them, the tech stacks I used, the challenges I faced, and how I resolved them.

I had four projects in total, and he specifically asked about my final year project as well as my first two projects — one based on Kubernetes and the other on Machine Learning. He was keen to understand which projects were group projects and which were individual, and for the group projects, he wanted to know my specific contributions and how I coordinated with my team.

The interview was relatively brief, lasting around 25 minutes, but it went well. Towards the end, he again asked if I had any questions. I asked about the kind of work an Analyst does and the typical career progression from Analyst to Associate Consultant, which he explained in detail.

Unlike some other candidates, I was not asked about location preferences. Everything was going smoothly, and the interaction felt positive and engaging. Unfortunately, despite a good technical discussion, I did not get selected for the HR round.

4. **HR round**

The HR round was a brief 10-minute online meet that mainly covered basic HR questions. I was asked about my hobbies, strengths and weaknesses, and why they should hire me. The conversation felt largely formal in nature, serving more as a procedural step rather than a detailed interview.

Shortly after this call, I received my Letter of Intent from KPMG. Overall, this experience was quite different from what my peers and friends went through, making it a unique and memorable process.

Out of these 4 candidates from the HR round, 3 were sent a Letter of Intent and 1 candidate from the technical round 2 (that was me) was also sent a letter of intent.

Useful Tips:

1. **Prepare for Quantitative Analysis and Aptitude:**

For companies like KPMG, aptitude and quantitative analysis play an important role. Practice regularly on platforms like GeeksforGeeks, IndiaBix, or other competitive aptitude sites. Time management is crucial, so focus on both accuracy and speed.

2. **Resume:**

- **Use a clean and professional format**, such as a LaTeX template.
- **Keep your resume ATS-friendly** to increase the chances of being shortlisted.
- **Be precise and impactful:** describe your projects in 2–3 points each, and quantify your achievements wherever possible. Numbers and results stand out.
- **Prepare your resume thoroughly from start to finish:** Make sure you are familiar with every detail, description, and word mentioned in it, so you can confidently discuss any aspect during the interview. Being well-versed with your own resume shows professionalism and

helps you answer questions accurately and convincingly.

Parnika Das Resume

3. **Internship and Work Experience:**

From my observation, candidates with some form of internship experience tend to have an advantage, especially in technical rounds. Even part-time internships or summer projects provide real-world exposure and talking points for interviews. This is not a strict rule, but it definitely helps strengthen your profile. (It helped me a lot to stand out)

4. **Strengthen CS Fundamentals and DSA:**

Prepare both the theory and coding aspects of computer science. This includes:

- Data Structures & Algorithms (DSA)
- Computer Science fundamentals like Operating Systems, DBMS, Networking, etc.
- Solve as many coding questions as you can. Do the questions on your own, and if you are not able to do it, learn it from any explanation video and do it by yourself. Follow the Strivers' sheet or Leetcode Top Interview 150. And for SQL, you can solve LeetCode SQL 50.
- Practising coding problems regularly will build confidence for technical interviews.

5. **Communication is Key:**

Your ability to communicate effectively is often the first impression you make. Clear and confident communication can give you a significant edge over other candidates. Practice introducing yourself, explaining your projects, and discussing your experiences concisely and engagingly.

6. **Maintain Confidence and Positivity:**

- Keep a smile on your face during interviews.
- Show confidence without arrogance. (Most Important)
- Put in the effort to make a strong impression on the interviewer.

7. **Academic Performance Helps:**

A good academic record (preferably 7.5 GPA or above) adds weight to your profile. However, academics alone are not enough - balance it with projects, internships, and skills.

8. **Early and Consistent Preparation:**

- Start placement preparation as early as possible.
- Maintain a healthy balance between studies, skill-building, and personal life.
- Consistent effort beats last-minute cramming.
-

9. **Resilience and Patience:**

Placement journeys are rarely smooth:

- At first, you may struggle with clearing online assessments.
- Even after clearing OA rounds, you might get rejected in interviews.
- Sometimes, rejection happens even after the HR round, which can be heartbreaking.

Key: Don't lose hope. Hard days are part of the journey, and persistence is what separates success from failure. Give your 100% in every attempt, but also accept that *luck plays a great role*.

10. Believe in Yourself:

- Put in your best effort.
- Keep improving, learning, and refining your skills.
- Stay motivated, even when facing setbacks.

My Overall Placement Experience

I started my journey by attempting several Online Assessments (OA), which were initially challenging. Gradually, as I improved my speed and accuracy, I began clearing OAs after 5 tests or something, but then faced rejections in interview rounds. In one process, I was even rejected after the HR round, which was very disheartening.

During my interviews, I focused on presenting my projects, internships, and experiences clearly, highlighting the technologies I worked with, challenges I faced, and how I resolved them. I made sure to stay confident, smile, and communicate effectively, which helped me leave a positive impression.

I practised quantitative aptitude, DSA, and CS fundamentals rigorously and maintained a decent academic record alongside internships and projects. I also asked thoughtful questions about the role and career growth, which left a strong impression on the interviewers.

Despite the ups and downs, I learned to stay persistent, balance preparation with personal life, and give my best in every attempt. Receiving the Letter of Intent from KPMG was the culmination of all the hard work, and the experience was truly unique compared to my peers. I believe the key takeaways were patience, consistency, preparation, and belief in oneself.

All the Best!!!
