

Company: NOMURA

Job Profile: GM

Offer Type: Internship + Placement

Internship Stipend: 75K

CTC: 13.66LPA(2L Joining Bonus + 11.66L Base)

Location: Powai

Process Date: 1st August 2025

Placement Process:

The entire placement process is a very long and stressful period. Before Nomura I had given 4 interviews, even reached the last round in 1 and got rejected. But the important thing in this process is that you have to keep patience and keep on pushing. Keep talking with your friends and your parents. Luck is a very important factor in this placement process but that too will only work if you keep working hard.

About GM Role :

On 31st July, at around 8p.m. I found out that my resume had been shortlisted for the GM role. I did not know anything about the role and called up a senior to find out about the role. Even though the JD says Global Markets Analyst(which sounds non-tech) the role is completely a tech based role which closely works with the Global Markets division of Nomura. The title of the JD even said tech focused intern. The senior told me that all the work he was doing there was tech related along with exposure to finance(something that I was looking for). He also guided me how to approach the interviews and how to prepare for GD which was going to be the first round.

GM JD - https://drive.google.com/file/d/1ZnsTaifPX5qplLdzshR0_k1uR72aqFyr/view?usp=sharing

1. Group Discussion [18 Students appeared for this round]

The first round for GM is a Group Discussion round. This round lasted for around 30 minutes. We had a group of 8 students. The topic was pretty easy on is AI making us smarter or dependent. Before the GD we as a group had decided that we would not cut each other mid sentence(can disagree though). This ensured that our GD went smoothly without screaming or any fighting. The key in this round is to be confident in what you are speaking. Take a paper or a small notebook and note what your peers are saying as well so you can add to their points or disagree with them. Any youtube video showing how to act in a GD should suffice.

2. Technical Round-1 [10 students were shortlisted]

After 10 minutes of finishing the GD, I was called for my interview.(So if you are the first one called up you might not get time to prepare so be ready beforehand). This round lasted for around 40 minutes. Firstly he asked me to introduce myself and walk through my resume. Simple DSA questions were asked like sort the array(I gave 4 approaches). I offered to write pseudocode for merge sort as well but the interviewer was

happy with my explanation. I was also asked to implement a linked list using a stack(simple 2 stack approach(a FIFO data structure using LIFO)). I was asked a few questions on linked list as well such as finding the middle of the linked list and checking if the linked list has a cycle or not(easy, slow and fast pointer approaches). He asked if I knew python but I told him I only used python for api calls to Gemini. He said it's fine and moved on. Then he asked on my projects and told me to draw the architecture of one of my projects.(a simple drawing of frontend, backend, load balancer and how the request is serviced).

[Middle of Linked List](#)

[Linked list has a cycle or not](#)

[Merge Sort](#)

A few tips for this round:

1. Prepare a solid Introduction covering everything in your resume and focusing on stuff you are confident at.
2. Whenever given a question, walk through the entire solution from start to finish with the interviewer. They are more interested in how you are approaching the problem. If you don't know something, ask for a hint but don't go silent.
3. Practice DSA so that even if a simple question is asked you are able to confidently answer it.

3. **Technical Round 2** [6 students were shortlisted]

I read the interview experience of my senior before this round and they said that Nomura asks puzzles. So I went through the first 10-15 puzzles of GFG top 100 puzzles. To my luck, I was asked one puzzle from there itself and I went through the solution of the puzzle in detail with the interviewer. After this I was given a medium level SQL query to solve.Given a table lets say Data, for every Note, print the entire row with the max transactions

Notes	Pipeline	Transactions
N1	P1	400
N1	P2	500
N1	P3	200
N2	P1	400
N2	P2	300
N3	P1	100

Output

Notes	Pipeline	Transactions
N1	P2	500
N2	P1	400
N3	P1	100

Normal GROUP BY notes would not work as then you wouldn't be able to print pipeline or else you would have to include pipeline in your GROUP BY as well but that would not give correct output.

ANSWER

```
Select d.notes, d.pipeline, d.transactions
From Data as d
INNER JOIN ( SELECT Notes, max(transactions) as maxtrn
             From data
             GROUP BY Notes) as t
ON d.notes = t.notes AND d.transactions = t.maxtrn
```

Another way is to use WHERE (notes, transactions) IN and the same subquery as above

After this I was asked a DSA questions Merge Intervals. Again pretty standard.

After this I was asked to walk through my resume projects and was asked some React questions related to Virtual DOM, hooks and callback questions. I was not very confident in all my answers but tried to answer as much as I knew. After this he also told me to explain the system of one of my projects and the use of RabbitMQ(which I had used). I was able to answer it. In the end I asked him a few questions about Nomura and if there was anything he would like me to explain again.

Puzzles

A few tips for this round:

1. Prepare all your Projects in your resume thoroughly. From tech stack to why did you use that tech stack. Whatever you use in your projects, lets say MERN, read top interview questions for it.
2. The JD mentioned python and React. I didn't know Python in detail so I honestly said I don't know and they were fine with it. Dont try to force something that u dont know because if they ask questions and you are not able to answer it leaves a bad impression.
3. Practice SQL top 50 on leetcode.

4. **HR Round** [4 students were shortlisted]

This was actually my longest round. The interviewer asked me a lot of questions. It started with my understanding of the role. Then he told me what I would have to learn for this role and I answered honestly that I didn't know half of the stuff mentioned in the JD. Then I was asked 3 words to describe myself. Then he asked me about my hobbies. He told me how my friends would describe me and 3 of my bad qualities as well. Then he asked me what gets me motivated and how to motivate me as well. He asked me about my family background. The key point for HR is to answer everything honestly. Don't prepare a lot before this round. Read a bit about the company and JD . They don't want someone who is mechanical.

2 students were offered the job for this role. I was one of them :)

Useful Tips:

1. Write only the stuff in your resume that you are able to answer.
2. Read about the company and the JD before sitting for the interviews.
3. Keep smiling and appear confident
4. Try to polish your communication skills as this is how the interviewer judges you. If you are not able to communicate your answer to the interviewer then it doesn't matter if your answer was perfect. Mock interviews are of great help in this aspect.
5. Ask questions in the end related to their role in the company or something else you are curious about
6. DSA, SQL, DBMS, OOPS are some of the most important concepts
7. Try to learn JAVA as well, but if you don't know, it's nothing to worry about. The interviewers want to check if you are ready to learn and quick to learn.
8. It is not important to have very unique and different project. A decent enough project is fine but make sure you know in and out about the project(Why did you use the tech stack? Why not something else?).
9. Read top interview questions of your tech stack as well
10. Lastly, luck plays an important role.
