

Pranav Nair **(COMPS)**

Company : Oracle Financial Services Software
Job Profile: Associate Consultant
Offer Type: Placement Only
CTC: 9.82 LPA
Location: Mumbai , Pune, Bangalore,Hyderabad
Process Date :8th October 2025

Placement Process:

- 1) Online Assessment Round: (36 Questions 120 minutes)
- 2) Technical Interview I
- 3) Technical Interview II
- 4) HR round

1) Online Assessment Round:

The online assessment was conducted on the HackerRank platform, consisting of 36 questions to be solved in 120 minutes. The test covered a mix of topics including Computer Networks, Operating Systems, SQL, Logical Reasoning, Probability, and Puzzles, along with two coding problems based on Tree and Dynamic Programming (DP).

There were also multiple SQL query-based questions that tested basic to intermediate understanding of joins, aggregate functions, and constraints. The non-technical sections focused on logical reasoning and quantitative aptitude, including probability-based word problems and short analytical puzzles.

The good part was that we got to attempt the test online from home since it was raining heavily that day, which definitely reduced some stress. Overall, the OA was moderately difficult. The key was to maintain speed while balancing accuracy across both the technical and reasoning sections.

IMPORTANT NOTE: We had given OA for the Associate Application Developer, and we weren't told that the selection for Associate Consultant would be taken according to this OA result. So if you are giving the test for Associate Application Developer then give it 100%.

2) Technical Round I: [27 students were selected for the technical interview]

The interview started after a PPT presentation from Oracle at around 12:00 PM.

We had 6 panelists and I was in the 1st 6 group. So I was taken to the room where my panelist was sitting. As soon as I entered the room, The interviewer stood and walked towards me to

greet me with a **FIRM** handshake (i have emphasized firm because it is important as it shows how confident you are). After all the greetings, he asked me about how my day was, and frankly speaking that day we had our MSE and we had just given our test and came for the interview. So I told the interviewer about it, and he talked about it for almost 5-10 mins about my day.

After this casual conversation, he asked me which programming language I was comfortable with. I told him I was comfortable with c++. So he firstly asked me the difference between for and while loop, is there any difference. I answered the way he wanted and then he asked me to print numbers between 5 and 10 using a while loop. I wrote the code directly and explained it to him. Then he gave me two strings, one with all capital letters and another string with the same letter but a mixture of small and capital letters, and asked me to return true if the string matched or return false if it didn't. There was no restriction in using the in-built function of the language. So I simply used the direct string comparison. Then he modified the question that he wanted two equal strings even though they have different ascii values to return true while comparing. Here I used the in-built function of string to capitalize the whole letter in both the string and then compared it. While coding he wanted me to include a try-catch function for any error handling, but I hadn't revised that topic so I honestly told him that I hadn't revised the error handling section but I explained how error handling would work if included. He was satisfied with my answer.

My interviewer then shifted to the DBMS topic and gave me 2 questions to solve.

1. Two table i.e. The Train and Destination table was given to me and he had asked me to find the cost of all the trains that stop and start from Mumbai. So this question was easy, we just had to join two tables and use the where clause to find the answer.
2. Same two tables and was asked the train with the highest travel time.

Later he asked me about all the projects I had done. He asked me whether the projects done were individual projects or not. All the projects I had mentioned were all group projects. As it was all a group project, he asked me what exactly my role was in each project and what was the purpose of our group choosing those topics for our project. And with these questions my interviewer concluded with the interview and asked me whether I had any question for him. I had asked him about his role in OFSS and asked him what role we would play in the company as a fresher.

So I was interviewed for almost 40 min and the interview ended on a good note.

NOTE: Don't throw things randomly on the resume and even while answering the question asked by the interviewer as it would lead to many follow up questions related to it and if you couldn't answer those questions it would affect your result. So be **HONEST** and give the interview with confidence, it's ok if you are unable to answer the question, you can tell the interviewer that you are unable to recall the concept, but would be able to tell it once revised. **HONESTY** and **CONFIDENCE** is the key for any successful interview.

2) Technical Round 2: [around 20 students appeared for it]

After my round 1 interview, nearly 15 min later i was asked to be ready for round 2 interview. I was taken to the room for round 2 and the interviewer greeted me and immediately started with the interview.

The Interviewer asked me to explain one of my AIML projects in detail. He wanted me to explain the whole project in such a way that i am explaining it to a non tech background person. So I started with a brief description about my project and then dived deeper into the explanation about the models that I had used. I systematically explained to him how the system architecture looks like and works. He was satisfied with the explanation, then he moved on to my Web project. He asked me about the purpose of choosing a book reading website and what new features were added in comparison to the inspired website. So I explained to him about the project and the purpose of the project along with what new features we had added.

Then he started to ask me about the techstack that i had worked on and why those techstack were used. He later grinded me upon the programming language that I had written on the resume. He first asked me to write a code to open a file and read the file in python language. Before i started with writing the code i asked him a follow up question of what type of file does he want me to read, he gave me the benefit of doubt to use any file type. So I used a CSV file as the input file to be read, and I wrote the code in python. I used pandas to read the file and show the content of the file. After this he started with **OOPS** questions, he asked me to explain **encapsulation, overloading and overriding**.

My interviewer then shifted to **DBMS** and asked me a question where I had to use **JOIN** and **GROUP BY** to solve the question. So basically most of the round people are being asked questions related to **JOIN and Clauses**. So focus on these topics and practice it.

After this i was asked a guesstimate question where i want to find the fastest route and mode of transport from my house to my college. He gave me the benefit of doubt to choose any method or electronic device to find out the optimal route and transportation. I answered the question using google maps, so hi follow up question how would you choose the transportation. My answer for guesstimate could have been wrong or not, but I explained what I know and concluded with the interview.

NOTE: As you can see in this round it was mostly about my resume, so it would be best for you to know what you are writing on your resume, whether you actually know it or not, before interview **LEARN EVERYTHING IN YOUR RESUME** so that whatever you are asked from your resume you able to answer it properly.

This round also took around 45-50 min to conclude.

Round 3 : HR round : [Around 12 students appeared for it]

The **HR round** was more of a formality. The HR asked a few basic questions such as my **nationality, hobbies**, and whether I was **satisfied with the compensation** offered. She also asked if I had any questions for her, to which I responded with two simple queries related to the company culture and growth opportunities.

After this round, there was a short waiting period of around 45 minutes while the panel discussed the results. Finally, the results were announced — **12 students were selected** for the role, including **6 from MCA** and **6 from B.Tech**.

Useful Tips:

1. **Be prepared for general questions:**
Practice introducing yourself and answering questions about your strengths, hobbies, and achievements in advance.
2. **DSA Preparation:**
 - Practice from **Striver's DSA Sheet**: <https://takeuforward.org/interviews/strivers-sde-sheet-top-coding-interview-problems/>
 - Watch **Striver's YouTube Channel**: <https://www.youtube.com/@takeUforward>
3. **Computer Fundamentals:**
 - Refer to **GeeksforGeeks**: <https://www.geeksforgeeks.org/>
(Focus on topics like OS, DBMS, Networking, and SQL)
4. **Java Preparation:**
 - Study in-depth from **JavaTpoint**: <https://www.javatpoint.com/java-tutorial>
5. **Aptitude:**
 - IndiaBix: <https://www.indiabix.com/>
6. **Confidence is Key:**
 - Confidence comes naturally when you are **well-prepared**.
 - Revise your concepts, practice mock interviews, and stay calm during the actual interview.
