

Ronak Walinjkar
CSE-DS

Company: Quantiphi
Job Profile: Framework Engineer
Offer Type: Internship + Placement
Internship Stipend: 24k/month
CTC: 8.5 LPA
Location: Mumbai(Mostly) /Bangalore
Process Date: 21/8/25(OA) , 22/8/25(Interviews)
Resume : [Ronak Resume](#)

Placement Process:

1. Online Assessment [191 applied on unstop and 133 shortlisted for test]

The test was held on campus via Unstop with rigorous proctoring. It contained three sections – Aptitude, Technical MCQs, and Coding. Each section had a sectional timer.

- **Aptitude (40 questions in 35 mins)** – The questions in this section were easy, but the main challenge was time management. Don't spend too much time on a single question; try to solve as many as possible within the time limit.
- **Technical MCQs (33 questions in 25 mins)** – This section included Web Development (HTML, JavaScript-based) questions, as well as questions on **OS, DBMS, and OOPS**. The questions were mostly standard, but some were tricky and required careful attention.
- **Coding (3 questions in 30 mins)** – There were three coding questions:

1. **Minimum Robbing Speed** – A thief wants to rob all the houses in a village.

Given an array representing the number of houses in each neighborhood and the

maximum amount of time (in hours) available, find the minimum speed (houses per hour) required to rob the entire village.

2. **House Robber Problem** – This was the classic House Robber problem from LeetCode, solvable using a standard Dynamic Programming approach.
3. **Maximum Loot on Islands** – Given an undirected graph of n islands, each with a loot value, and edges representing travel paths with travel times, a pirate can start from any island and visit each island at most once. The total loot is the sum of the visited islands' values, while the total time is the sum of the travel times along the chosen path. The task was to find the maximum loot which can be solved by direct Dijkstra's Algorithm.

I was able to solve the first two questions but couldn't attempt the third one due to time constraints.

2. Technical Interview – Round 1

The interviews were conducted the next day and FE was my first preference. I was shortlisted for FE role. Although there was an option for students to switch roles as well. Some students had their interviews in online mode, while others had them offline. Mine was in offline mode.

The interview started with my introduction. Then the interviewer asked me about my Major Project focusing mainly on its real-world application. Next he asked me about my Internship project at TCS and asked me to explain it in detail which I have implemented using Google Cloud Platform. Then he asked me a simple programming question of Checking whether a number is a palindrome or not. I have started with a brute force approach and then explained the optimal one. He also asked me questions about the other projects mentioned in my resume, focusing mainly on how I implemented specific features and the reasoning behind them. Finally I asked the interviewer a question and the interview was concluded.

I was able to answer almost every question in this round and felt confident that I would advance to the next round. This interview lasted for around 45 mins.

3. Technical Interview – Round 2

After about 30 minutes, I was informed that I had been selected for the second round and was called in for the interview.

This interview started with a self-introduction. Then, the interviewer asked me about my internship project. He further asked about the difference between SQL and NoSQL in DBMS, followed by a discussion on normalization. After that, he asked me to design a database schema for a company with users as students, employees, teachers, and staff. His main objective was to assess my understanding of storing data in a normalized form. Next, he asked me to write a SQL query on the schema I had designed, having GROUP BY and ORDER BY operations. After this, he asked about the difference between JWT and Cookies. He then moved on to Sockets and Polling concepts. Further, he asked some basic Python questions such as the difference between lists and tuples and how multiple inheritance works in Python. Finally, he asked me about my Major Project.

In this round, the interviewer cross-questioned frequently to test my depth of knowledge. I was able to answer almost every question except for the one on Sockets, where the interviewer gave me a hint, after which I was able to respond correctly.

Tip: Try to answer theoretical questions with real-life use cases or examples to demonstrate a deeper understanding of the topic

4. HR Round

After about an hour, I was informed that I had been selected for the HR round.

The HR round began with my self-introduction, followed by questions about my family background and where I live. Then, the interviewer asked me to pitch one of my projects of my choice in one minute as if I were pitching it to an investor. He also asked about the challenges I faced while working on that project. Next, he moved on to behavioral questions such as:

If I assign you a project about which you have no prior knowledge, how would you approach it?

If you are assigned three tasks with tight deadlines, how would you prioritize and work on them?

He also asked a guesstimate question to estimate the number of daily users on YouTube. Lastly, he asked me why I want to join Quantiphi and where I see myself in the next five years.

Around 9 PM, all interviews were concluded, and the team went inside the conference room to discuss the results. Everyone waiting outside was very tense, and I was silently praying to God. Finally, around 9:45 PM, the results were announced—8 candidates were selected, including me (for the FE role). **Among the selectees, 2 were for MLE, 3 for FE, and 3 for BA roles.**

Useful Tips:

Stay Positive and Believe in Yourself : The placement process can be long and stressful. Losing hope or feeling demotivated is absolutely normal, but always believe in yourself and keep putting in consistent effort. Better things are on the way. Talking to your friends and family during tough times really helps keep your mind calm and motivated.

Prepare Based on Company Patterns : Go through previous interview experiences for the company you're targeting. Some companies grill your resume thoroughly, some focus on Java or DSA, while others might focus on computer fundamentals. Knowing the pattern helps you prioritize topics effectively.

Know Your Resume Inside Out : Be prepared for questions like “Why did you build this project?” or “How would you improve it further?”. Small bluffs are fine, but avoid putting anything on your resume that you can't confidently explain.

Cover Both DSA and Fundamentals : Don't limit yourself to DSA alone. Computer fundamentals like OS, DBMS, OOPS, and Networks are equally important. For DSA, go through Striver's Sheet and give contests on CodeForces and LeetCode. For computer fundamentals, practice from Sanfoundry or GFG. These will help you in Online Assessments as well as interviews.

Stay Calm During Interviews: Interviews can be nerve-racking. I once felt nervous in an interview and ended up answering wrongly, which got me frustrated and affected my confidence

for the remaining questions. To avoid this, practice mock interviews with friends or seniors. They help you get comfortable under pressure.

Trust the Process and Don't Compare : Trust God's plan and your own journey. Failures are an unavoidable part of growth. Don't compare yourself with others—it only adds unnecessary stress. Virat Kohli waited 18 years to win his first IPL trophy, while Rohit Sharma lifted his first one just a year after the league began . **Everyone has their own timeline; enjoy your journey without rushing through it.**

JUST TRUST THE PROCESS. ALL THE BEST !!!
