

Aarya Deshmukh

CSE AIML

Company: TransUnion

Job Profile: IT Developer/ Quality Engineer

Offer Type: Internship + Placement

Internship Stipend: [Not Mentioned]

CTC: ₹8 LPA + ₹1 Lakh joining

Location: Pune/Bangalore/Hyderabad/Chennai

Process Date: September 4-5, 2025

Placement Process:

Total 3 rounds: Online Assessment, Technical Interview, and HR Interview.

1. Online Assessment [90-100 students appeared]

The round consisted of four sections: Logical Aptitude, Quantitative Aptitude, Coding, and a Verbal Section. Everyone received two different coding questions, and the difficulty level was quite random. Some students received easy questions involving HashSets or HashMaps, while others got difficult Dynamic Programming (DP) questions.

Thankfully, I received very easy questions:

1. Remove duplicate elements from an array and return the unique elements.
2. Count the frequency of each character in a string.

Tips:

- Practicing aptitude questions from IndiaBix and GeeksforGeeks (GFG) is sufficient. Just remember the patterns and formulas to solve similar types of problems.
- These patterns are repetitive in every Online Assessment, just presented in different forms.
- For Data Structures and Algorithms (DSA), start practicing as soon as possible. I regret starting only one month before placements.
- However, if you are starting late as I did, you can still succeed. Better late than never, but I still recommend starting your DSA preparation a minimum of six months in advance.
- There are students who get better offers without practicing more than 10 DSA questions, but this is an exception and relies on luck, so don't depend on it.

2. Technical Interview [32 candidates appeared for this round]

My technical interview was unique. It's important to know that everything depends on the panel you are assigned to. There were three panels, with two panelists in each. The difficulty level and types of questions were not standardized across all students. You will realize this after a few interviews. My panel was very relaxed.

They didn't ask me for a formal introduction. Instead, they asked how my preparation was going, how I had prepared for TransUnion, when I started, and if I had spoken with any seniors from my college who work at the company. You might think these are easy questions, but your answers, where you might mention various technologies to impress them, will determine the direction of the interview. I didn't mention DSA or SQL in my answers because I was not confident in my skills in those areas.

The interviewer then asked me to explain my projects. This is a question asked in every interview, so you should have 100% knowledge of your projects. Mostly, the interview will focus on the first project listed on your resume, and sometimes a second one. After I explained my project, they presented some edge cases and asked how I would handle large amounts of data and improve the execution time.

Then, they asked me how I would handle a Git conflict and what prompt I would give to ChatGPT to help resolve it. Next, they asked how I would run the project on another system. I answered with "Docker," which led them to ask more in-depth questions about cloud computing. However, I stopped them and explained that I haven't worked with cloud computing technologies and don't have much knowledge about it. It's okay to admit when you don't know the answer to a question. Don't try to give a wrong answer; just be honest. However, you shouldn't say "I don't know" for every question.

They also asked about a hackathon I participated in: why my team placed in the top 10 and not first, what went wrong, and what I learned from the experience. Then, they asked me to explain Docker to a layman with no technical knowledge. The interviewer was quite impressed with my analogy. Finally, he asked if I had any questions for them. I asked them 3-4 questions. The interview lasted for 27 minutes.

Tips:

- When you enter the room, greet them with a smile and a handshake.
- Give your introduction confidently because the first impression is the last impression.
- You should know the in-depth meaning of every word on your resume. It's not about the number of technologies you list, but how well you know them.
- There are standard questions asked about projects, such as: how you would handle a large amount of data, how you would scale the system, why you used a specific technology, and how you would improve performance.
- You are the driver of the interview, so the conversation will likely follow the direction you set with your answers.
- I wasn't confident in DSA and puzzles, so I avoided mentioning them. However, this completely depends on the panel. Other companies or panels will definitely ask more technical questions on CS fundamentals like OS, OOPS, DSA, and DBMS.

- If there are two interviewers, try to maintain eye contact with both. Keep a smile on your face to show confidence.
- They often prioritize motivation and a positive mindset over just technical expertise.
- Ask for their names at the end if they didn't introduce themselves at the beginning.

p

3. HR Interview [10-12 candidates selected for this round]

There was one panel with two panelists. Both were very relaxed. They started with small talk, asking how my day was going and if I'd had lunch. Then, they asked me to introduce myself, focusing on aspects not mentioned in my resume.

When asked to explain my project, I didn't get too technical. Instead, I focused on storytelling: how I got the idea, my approach, how I collaborated with my team, and the project's future scope.

They then asked about my family background, if I had any issues with relocation, why they should hire me, and if I had plans for a master's degree. Finally, they asked if I had any questions for them. I asked a couple of questions and made sure to shake their hands before leaving, as I had forgotten to do so at the start.

[8 students received an offer including me]

Tips:

- I saw many people with good technical knowledge who were not selected after the HR interview.
- Therefore, try to improve your English fluency. I understand if you don't come from an English-medium background (Like me), but at least try to speak confidently, even if you make a few grammatical mistakes.
- Always smile during the interview.
- I feel that the HR interview is about engaging the interviewers with your communication skills, like telling a story about your projects and your learnings. Don't dive deep into technical terms; they are generally not concerned with those details.
- Try to show them what a good team player you are.
- Confidence, a smile, and honesty are the keys to succeeding in the HR interview.

Useful Tips:

- Don't take the placement process lightly.
- Prepare well for placements, especially for the Online Assessment. For DSA, I recommend following only one resource instead of multiple. For example, if you are following a specific YouTuber, stick with them. If you are following a specific problem sheet like Striver's or NeetCode's, pick one and complete it fully.
- Have at least 1-2 strong projects; it's fine if your other projects are simpler.

- This was the 6th company I interviewed for. I made several mistakes along the way, and you will too, but it's important to believe in yourself.
- Keep pushing. If you don't get selected, don't worry—just start again. I have seen students who cleared their interview on the first attempt and others who were not selected even after interviewing with 10+ companies. But I am sure they will all make it eventually.
- I started my project work and OA prep only one month before placements. I still succeeded, but I missed many opportunities along the way. In the end, it was a happy ending.
- I believe that if I can do it, you can too.
- Just believe in the process. When you get the offer, you will definitely feel that it was all worth it.
- All the very best for your placements! Don't take too much stress.
