

Company: TransUnion

Job Profile: Developer/Quality Engineer

Offer Type: Full time

CTC: 9 lpa

Location: Pune/Chennai/Hyderabad/Bangalore

Process Date: 05 September 2025

Placement Process:

1. Online Assessment [Around 90 Students Appeared]

The Round Consisted of 4 Sections

Logical Aptitude, Quantitative Aptitude, Coding and Verbal Section

Everyone had 2 different coding questions and the difficulty was pretty random. Some got really easy hashset or hashmap questions and some got hard dp questions.

I got a simple array question where i had to add the elements from alternate indexes and this

leetcode.com/problems/maximum-number-of-weeks-for-which-you-can-work/

2. **Technical Round 1** [Around 30 students appeared in this round]

There were two interviewers for every panel. In my interview I was asked to introduce myself and then the panel first asked me about my projects, focusing mainly on the idea and what it does rather than the technical details. Since one of them was a blockchain project, they asked how I verified users in it and that was the only technical question I was asked related to my projects.

Then the discussion moved to OOPs. They asked me what is oops and then asked about encapsulation, polymorphism and to write code for method overriding. They asked me the difference between final, finally and finalize in Java. After that, I was asked to write code to print prime numbers from 1 to 100. I gave the brute-force solution, and was prepared to give the optimal answer if they asked but they didn't ask me to optimize further.

One interviewer then asked about AI, ML, and DL, and how I would approach building a chatbot for student queries. I tried explaining, but wasn't doing a good job so they told me it was fine if I didn't know. They actually first asked me if I knew AI and I thought they meant like in general so i said yes. I didn't have any AIML projects on my resume. If they ask you if you know smth that is not on your resume, try to clarify what they mean and it's okay to accept that it's not your strong suit. **But only if it's not on your resume.**

Then I was asked to rate myself in SQL, explain normalization, and give an example. I created a table and applied 1NF, and they said that was enough. I was asked about joins and they also asked me to write a query to find the top 10 students with the highest marks.

They gave me the Lion, Goat, and Grass puzzle, which I already knew, but I clarified the rules before explaining the solution.

Towards the end, I was asked about a challenge I faced in my project, so I shared how I resolved a feature issue in my major project. Finally, I asked the interviewers about their roles and whether there was anything I should start learning that would help me if I joined TransUnion. They suggested a few technologies they use at TransUnion.

3. **HR round** [10 Students appeared in this round]

There were two interviewers in this round too. The round started with my introduction and then they asked me to explain my projects, again, focusing only on the idea and features, and then asked what was unique about one of them. I was also asked about the technologies I'm familiar with and whether I had any cloud experience. I honestly told them I know the basics but don't have practical experience. They then asked what I knew about TransUnion and if I recognized them from the PPT. I remembered their names from the session but not their roles. Other questions included my family background, willingness to relocate, challenges I faced in college, and whether I had worked on team projects and dealt with conflicts.

At the end, they asked if I had any questions for them. I asked the same thing, if there was anything I could start learning now that would help me at TransUnion, and they gave me some useful advice. Since the PPT had mentioned a budget for learning and certifications, I asked about that and that concluded the round.

8 students got the offer in the end.

Useful Tips:

This was the 7th company I interviewed for, so from all my rejection experiences here's what **not** to do:

1. **You don't need to shoehorn technologies that you're barely familiar with into your resume.** It's not even about honesty—most of the time it just does more harm than good. I've seen people with HTML/CSS projects in their resume get into elite companies. A lot of interviews only test your computer fundamentals and whether you know the things you're claiming to know. So keep your resume simple and limited to things you are sure about, because you'll only make things harder for you by putting in things you don't know.
2. It's not a viva, so don't just answer—explain. For example, if they ask you about foreign keys, don't just give them the definition. Tell them what it is, why you use it, how you use it, and maybe throw in an example if you can. The more you talk, the fewer questions they'll ask.
3. In Interviews only you know what your project is so if they ask u to explain it dont start throwing technical jargon immediately. Tell them what your project does and its features first and only get technical if they specifically ask you to.
4. It took me an embarrassing number of interviews to realize sometimes I speak really fast, so the person I'm talking to doesn't even understand what I'm saying. In interviews, don't rush. Speak slowly and clearly, and give mock interviews to your friends so they can help you fix simple mistakes like these.

As for what to do, GFG is good for all the core subjects and check out top 20 puzzles on GFG, a lot of companies ask questions from that. Remember examples for OOPs and DBMS concepts.

Placements are a tough time for everyone. Don't start panicking or get demotivated after rejections just keep applying and trying your best.
