

Jagdish Aade

EXTC

Company: TransUnion

Job Profile: Engineering - Web / Software

Offer Type: Internship + Placement

Internship Stipend: [Not Mentioned]

CTC: ₹ 900000 per Annum

Location: Pune/Chennai/Hyderabad/Bangalore

Process Date: 4th -5th September 2025

Ensure your resume is ATS-friendly with standard formatting and clear headings, and maintain a CGPA of 7.5 or above, as most companies require this.

TransUnion criteria: 7 CGPA

The selection process consisted of the following rounds:

- 1. Pre-Placement Talk (PPT)**
- 2. Online Assessment**
- 3. Technical Interview**
- 4. Techno HR Interview**

1. Pre-Placement Talk (PPT)

The PPT was conducted offline and began a little late as all the company team members had not yet arrived. During this time, the HR ma'am interacted with us informally and invited five volunteers to perform a short skit. I was one of the participants in this activity. I advise actively participating in such activities, as they showcase confidence, help during the HR rounds, and leave a positive impression on the recruiters.

Afterward, the company representatives delivered their presentation, providing a detailed introduction about the organization, its work culture, and the career opportunities available. I would also suggest asking relevant doubts and clarifying queries during the PPT, as it demonstrates genuine interest in the company and further strengthens your impression.

2. Online Assessment [87 students appeared for this round]

The Test was conducted on **4th September** from **14:00 to 15:30** (1 hour 30 minutes). The test was hosted on **SHL**, and calculators were allowed. It consisted of **four sections**:

- 1. Logical Aptitude:** Easy to medium-level questions, including puzzles and pattern-based problems such as finding the odd one out or guessing the next number. Example questions included:
 - Find the odd one out: 121, 144, 169, 196, 225, 242
 - What comes next in the series: 2, 4, 8, 16, ?14 questions were to be solved in 14 minutes.

2. **Quantitative Aptitude:** Questions on topics like ratios, proportions, simple interest, and time & work. Example questions:
 - If a train travels 120 km in 2 hours, how long will it take to travel 300 km at the same speed?
 - Divide ₹720 among A, B, and C in the ratio 2:3:412 questions were to be solved in 12 minutes.
3. **Coding Section:** Two coding questions were provided, with difficulty varying randomly among candidates.
 - My questions were:
 1. Count the frequency of **special characters** in a string.
 2. Count the frequency of **numbers** in a given number.50 minutes were allotted for this section.
4. **Verbal/English Section:** Questions focused on grammar, vocabulary, and comprehension. Example:
 - Choose the grammatically correct sentence:
 - He don't like playing cricket.
 - He doesn't likes playing cricket.
 - He doesn't like playing cricket.
 - Understand the main idea conveyed in a passage.12 questions were to be solved in 14 minutes.

Note: The coding section difficulty varied significantly for different students. Some received easy questions involving HashSets or HashMaps, while others got challenging Dynamic Programming problems. My experience was comparatively easier, as my questions focused on counting frequencies, which I could solve efficiently within the time limit.

Tip: Start practicing aptitude questions well before placements, as most companies include them in their selection process. Additionally, regularly practice Data Structures and Algorithms (DSA) to handle coding sections efficiently.

3. Technical Round [32 students appeared for this round] [30-35 mins]

I. Introduction and Projects

- The interview began with a general introduction, followed by a discussion of my projects.
- **Projects and Challenges:** I was asked to explain all my projects in detail and describe the challenges I faced during implementation.
- **Language Preference:** The interviewer inquired about my preferred programming languages and which ones I was most proficient in.

II. Java and C++ Deep Dive

The main technical discussion focused on my **Java project**.

- **Core Java Questions:**
 - Why I chose **Java** for the project.
 - Key differences between **Java** and **C++**.
 - How Java achieves **platform independence**.
 - Which file is generated upon Java code execution.
 - The role of **JVM** and **JRE** in making Java platform-independent.
- **Memory Management in Java (Interview Q&A):**

The interviewer asked about types of memory in Java. I explained that the primary memory areas relevant for program execution are **Heap** and **Stack**:

 - **Heap:** Stores all objects and class instances created at runtime.
 - **Stack:** Stores local variables, method call frames, and references to objects in the heap.

- **Example:** In `public static void main(String[] args)`, local variables like integers or references are stored on the **stack**, while objects created using `new` inside `main` are stored on the **heap**.

III. Data Structures (Scenario-Based)

The interviewer presented real-life scenarios and asked which data structure I would use.

Scenario 1: Stock Market Prices

- **Scenario:** You are developing an application to track stock market prices throughout the day. You need to quickly retrieve the price of a stock at specific integer times, such as 9, 10, 11... 3.
- **Question:** Which data structure would you use to efficiently store and retrieve these prices, and why?

Scenario 2: Digital Signature (Undo/Redo)

- **Scenario:**
You have developed an application where, at the final step, the user needs to provide a digital signature. If the user creates a signature but is not satisfied, they can clear it and create a new one. Later, they realize that the previous signature was better.
- **Question:**
How would you retrieve the previous signature? Which data structure would you use and why?

IV. Coding and Problem Solving (Palindrome)

- **Problem:** Check if a given string is a palindrome.
My Approach ➔
- **Initial Solution:** Brute-force approach using extra space—reverse the string and compare with the original.
- **Optimization:** Explained time and space complexity of the initial approach, then provided an **optimized two-pointer solution**.
- **Execution:** Wrote the optimized code, explained it, and performed a dry run with a test case.

V. SQL Query

- **Problem:** Two tables of sales data were provided.
- **Approach:** Asked clarifying questions, explained the thought process, and decided to use **Joins** and **GROUP BY** to handle multiple entries per customer.
- **Solution:** Wrote a correct SQL query incorporating both Joins and aggregation functions.

VI. Closing

- The interview concluded with questions about my **extracurricular activities**.
- I also asked **1–2 questions** regarding the company's work culture and upcoming projects.

4. Techno HR Round [10 students appeared for this round] [15-20mins]

The interview began with my **introduction**, during which I introduced myself and briefly summarized my background. They then asked me about my **projects**, and I provided a concise overview of each. Following this, they inquired about my **achievements** and **participation in hackathons**.

They also asked which **interview I was currently giving** and why I **was not selected in previous attempts**. The discussion then shifted to **TransUnion**, where I was asked why I chose the company, what kind of work TransUnion does, and why I wanted to join. They also asked about my **position and responsibilities** in various committees, including how I mentored juniors and managed my tasks.

Next, the conversation moved to my **certifications**, including where I completed them and my basic technical knowledge. They also asked **why I am switching from Electronics to Tech**, my **weaknesses**, my **residence, family**, and how I managed **extracurricular activities alongside traveling**. I was also asked about my **career aspirations** and where I see myself in the next five years.

Towards the end, the interviewers gave me the opportunity to **ask questions and clarify any doubts** regarding the company or the role.

After the process completion 8 students got an offer and I was one of them.

Useful Tips:

1. **Maintain a Good CGPA:** Keep your CGPA above 7.5–8, as it helps meet eligibility criteria and creates a strong first impression.
2. **Resume Preparation:**
 - Use a standard, professional template (e.g., [Overleaf Resume Template](#)).
 - Make it **ATS-friendly**; check your score on [Resumeworded](#) (aim for 60+).
 - Be truthful—only include skills, projects, and achievements you can confidently discuss. Prepare 4–5 points for each.
3. **Company and Role Research:**
 - Understand the company's work, culture, and role requirements.
 - Prepare relevant questions to ask the interviewer—it shows interest and preparation.
 - Read the job description carefully and incorporate keywords into your answers.
4. **HR Preparation:**
 - Prepare for standard HR questions in advance to stay confident.
 - Keep answers authentic and personal; avoid over-reliance on AI for this.
5. **DSA and Problem Solving:**
 - Focus on understanding questions thoroughly rather than just solving many.
 - Solve standard problems first; daily practice on platforms like LeetCode or GeeksforGeeks helps.
 - Participate in contests to improve **time management**, an essential skill for coding rounds.
 - Always check constraints; write brute-force solutions first if optimal solutions are not obvious.
6. **Core Subjects:**
 - Prioritize important subjects like **DBMS** and **CCN**—often asked in technical interviews.
 - Choose open electives wisely (e.g., DBMS) to strengthen placement-related knowledge.
7. **Programming Skills:**
 - Master your primary language's basics.
 - Be confident discussing syntax, concepts, and memory management.
 - Practice explaining your approach during coding rounds; interviewers often guide you if stuck.

8. **Team Motivation:**

- Collaborate with peers with similar goals.
- Motivate each other, take progress follow-ups, and push to stay on track.

9. **Handling Rejections:**

- Treat rejections as learning opportunities. Focus on areas you can improve.
- Placement success also involves timing and luck, stay confident and persistent.

10. **Additional Skills:**

- Develop puzzle-solving and critical thinking through platforms like GeeksforGeeks.
- Practice guesstimates to improve analytical reasoning.
- Participate in **mock interviews** to enhance confidence, communication, and interview stamina

The placement process can be very hectic, and facing failures along the way is normal. **Don't give up**—keep giving your 100% and continue preparing consistently. In the end, all your hard work and perseverance **will be worth it..**
