

Company: UBS

Job Profile: GOTO Intern

Offer Type: Internship Only

Internship Stipend: 60k

Location: Pune / Hyderabad

Process Date: 14-07-2025

Placement Process:

There were 3 rounds for this process all within the span of 4-5 days.

Schedule:

1. Pre Placement Talk (Microsoft Teams): 10-07-2025 from 11.30am - 12.30pm
2. Online Assessment(Hackerrank): 10-07-2025 from 4.30pm- 6.30pm .
3. Interview Rounds (SPIT Campus): 14-07-2025

Make sure you are prepared beforehand as you will be notified a day prior to the OA Test and the Interviews of shortlisted candidates.

1. **Round 1: Online Assessment** [197 students appeared and it was conducted in college]

Platform: Hackerrank

Time: 85 mins

Questions

- **15 Technical Questions:**

These questions were based on CS Fundamentals majorly focusing on DBMS, OOPS, SQL and Java.

- **15 Aptitude Questions:**

The questions were easy to moderate. They were based on probability, profit/loss, sets, finding missing elements in series, mirror images, and answering the question on the basis of a given graph and statistics.

- **1 Coding question:**

Given an array of integers representing the latencies of different servers, your task is to find all pairs of latencies with the minimum absolute difference. Each pair should be returned in ascending order (i.e., [a, b] where $a < b$), and the final list of pairs should be sorted in lexicographical order. Return the result as a 2D array of these latency pairs. For example, if the input is [4, 2, 1, 3], the sorted latencies are [1, 2, 3, 4]. The minimum absolute difference is 1, and the valid pairs with this difference are [1, 2], [2, 3], and [3, 4]. So, the output would be [[1, 2], [2, 3], [3, 4]].

Python approach i used:

To find all pairs of latencies with the minimum absolute difference, first sort the array. Then, loop through the sorted array to calculate differences between consecutive elements. Track the smallest difference. If a new smaller difference is found, reset the result list with that pair. If the difference equals, add the pair to the result. Finally, convert the flat result list into a 2D array of pairs and return it. This ensures all closest latency pairs are captured and sorted correctly.

2. Round 2: Technical Interview[16 students were shortlisted for this round]

We were asked to report to college by 9:00 a.m., with the interviews beginning around 10:30 a.m. We had been informed a day prior to carry a fully charged laptop, an updated resume with a passport-size photograph affixed, and to be dressed in complete formals.

My interview began with a “Tell me about yourself” question, but the interviewer specifically asked me to walk through my journey like a story from childhood till now and talk about everything I had done or achieved. Then he asked me why I chose diploma. Since the interviewer wasn’t familiar with the diploma system, I also explained the entire process and its structure.

The conversation then shifted to my projects. He asked why I chose to build them, what problems they solved, what challenges I faced, and how I overcame them. Most of my interview revolved around my major projects. I focused on explaining the logic, technologies used, and real-world relevance.

He then asked me about my favorite programming language and why?., and he gave me a task to write a code on paper. The task was to print all missing numbers between a given list, like [1, 3, 4, 99]. After that he told me to walk through the code. I explained my approach: first sort the list, then use a loop to identify gaps and print missing numbers.

Next, the interviewer shifted to puzzles. He asked three logical/aptitude problems. The first was the classic Water Jug problem: how to measure 4 liters using 3L and 5L jugs. The second was the Torch and River puzzle involving four people with different crossing speeds (1, 2, 5, 10 minutes) and a single torch. I explained the optimal 17-minute solution. The third puzzle involved burning two uneven candles to measure 45 minutes which I solved using the trick of burning one from both ends. I answered all three correctly, which seemed to make a positive impression.

Toward the end, he asked me about my family background, including where I’m from and what my parents do. Finally, he gave me the chance to ask a question. I asked him what skills I should start learning if I got selected for this role.

Overall, the interview was a balanced mix of resume discussion, problem-solving, and personal insight and felt more like a two-way conversation than a strict Q&A.

3. Round 3: HR Interview[Around 8 students were shortlisted for this round]

This round felt more like a personal interaction than a formal interview. The questions were mostly background-oriented they asked where I stay, what my parents do for a living, and about my general family environment. It seemed like they were trying to get to know me better on a personal level and assess whether I would be a good cultural fit for the organization.

They also asked me how my technical interview went and followed up with questions like why I didn't continue my engineering at the same college where I completed my diploma. The entire round was quite short, lasting around 10–15 minutes.

Even though it was a light discussion, I would still recommend preparing well for generic HR questions including your strengths, passions, future plans, family background, and work preferences. Also, make sure to attend the Pre-Placement Talk and take notes many HR questions indirectly relate to the company culture and role expectations discussed during the session.

Finally results were announced, 3 students got selected, and I was one of them.

Useful Tips:

- Be calm, trust yourself and be confident during an interview.
- Know your resume inside out. Thoroughly review and understand every detail listed in your resume.
- Read about OOPS(in any language), DBMS, Computer networks and Operating systems.
- You should be able to explain your projects, your motivation behind the project, what problem is your project solving, your choice of technology stack over the other ones.
- Avoid panic, nervousness and overconfidence. Even you are stuck at a challenging question, let them know what your approach is they'll give you a hint, interact with interviewers, they will definitely help you out because they spend so much of their hours, money in finding the right candidate.

All the Best :)
